Air Quality and Fugitive Dust Management Annual Report 2023

ARTEMIS GOLD INC | Blackwater Mine

Air Quality and Fugitive Dust Management Annual Report 2023

EXECUTIVE SUMMARY

The purpose of the 2023 Annual Monitoring Report for Air Quality and Fugitive Dust Management Plan (AQFDMP) is to provide a summary of environmental incidents and complaints, all monitoring under permits, an assessment of the data, and recommendations as appropriate. This report also conforms to the requirements outlined in Developing a Fugitive Dust Management Plan for Industrial Projects (BC EMLI & ENV, 2023) and EAO Condition 3 which require that adaptive management be used to evaluate the effectiveness and direct continual improvement of the AQFDMP.

On July 10th, 2023, Davidson Creek wildfire (File Number: G41493) grew to 4,879 hectares in size, burning approximately 60% of the mine site. BWG evacuated all employees on July 9th with a gradual return to site starting the week of July 24th. Construction activities fully recommenced on August 3rd. On July 13, 2023, BWG provided notifications to regulators, including ENV, and First Nations to highlight the potential for missed sampling events during this time. Due to the fire a radiello was unintentionally deployed for 45-days and weekly carbon monoxide (CO) monitoring did not occur.

As of December 31, 2023, the project had completed approximately 60% of construction activities. No point source discharges occurred, as infrastructure was still in development. The following activities were conducted at the mine site in 2023, that may have resulted in the emissions of fugitive dust:

- Land clearing and earthworks for the construction camp and plant site.
- Construction and use of unpaved access and mine roads.
- Material handling/re-handling at aggregate and topsoil stockpiles.
- Parking lot and road grading.
- Construction of water management structures (e.g., diversion channels)
- Aggregate extraction from borrow pits.
- Borrow and Aggregate Crushing and Screening; and
- Concrete Batch Plant operations.

Air quality samples were collected between May and December 2023 and analyzed for Particulate Matter $(PM)_{2.5}$, PM_{10}, Nitrogen Dioxide (NO_2) and Sulphur Dioxide (SO_2). Based on the sampling and analytical program:

- $PM_{2.5}$ exceeded the value of the BCAAQO 9 times between May and December 2023. A true $PM_{2.5}$ exceedance of the BCAAQO is based on the 98th percentile of 24-hour measurements. This metric cannot be calculated in 2023 as there was not a 75% data completeness for $PM_{2.5}$ in 2023.
- PM_{10} exceeded the BCAAQO 12 times between May and December 2023.
- The highest concentration of $PM_{2.5}$ (192 ug/m^3) and PM_{10} (278 ug/m^3) were both observed on August 28, 2023.
- In total 23 samples were collected in 2023, with the highest SO_2 (concentration of 0.23 ppb (June 18, 2023) and the highest NO_2 concentration of 4.9 ppb (Dec 19, 2023).
- Radiello samples are collected over a 7-day period, comparison to the CAAQS hourly NO_2 and SO_2 concentrations is not comparable. The annual average concentration of NO_2 and SO_2 were below the BACAAQO and CAAQS.
- Although not directly comparable to BCAAQO, no CO monitoring events exceeded the value of the 1-hour BCAAQO in 2023.
- The highest CO concentration of 9 ppm was observed on May 13, 2023, at the Maintenance Shop. The annual average of all CO monitoring events was 0.18 ppm.

1 Introduction

1.1 Proponent Information

The Blackwater Gold Mine (the Mine) operated by Blackwater Gold Ltd. (BWG) is an open pit gold and silver mine. Construction of this facility initiated in October 2022 and is anticipated to take approximately 2 years, with first gold pour anticipated in H2 2024.

The Mine is located on the Nechako Plateau, a region of flat to gently rolling terrain on the northern slope of Mount Davidson. BWG is an open pit gold and silver mine located approximately 112 kilometres (km) southwest of Vanderhoof and 160 km southwest of Prince George, BC. The Project falls within NTS map sheet 93F/02, centred at 5893000 N and 375400 E (UTM Zone 10 NAD83). The mine site is centred at 53°11'22.872" N and 124°52'0.437" W. The Project is presently accessed via the Kluskus Forest Service Road (FSR), the Kluskus-Ootsa FSR and an exploration access road, which connects to the Kluskus-Ootsa FSR at km 148. A new, approximately 13.8 km road (Mine Access Road; MAR) will be built to replace the existing exploration access road, which will be decommissioned. The new planned access is at km 124.5.

Figure 1 identifies the Project location and the access route from Vanderhoof in relation to nearby communities.

The Mine is located within the traditional territories of Lhoosk'uz Dené Nation (LDN), Ulkatcho First Nation (UFN), Skin Tyee Nation and Tsilhqot'in Nation. The Kluskus and Kluskus-Ootsa FSRs and Project transmission line cross the traditional territories of Nadleh Whut'en First Nation (NWFN), Saik'uz First Nation (SFN), and Stellat'en First Nation (StFN; collectively, the Carrier Sekani First Nations) as well as the traditional territories of the Nazko First Nation (NFN), Nee Tahi Buhn Band, Cheslatta Carrier Nation and Yekooche First Nation (BC EAO 2019a, 2019b).

1.2 Facility and Process Description

Major mine components that started construction in 2023 were tailings storage facility (TSF), water management pond, central water transfer pond, ore processing facilities, soil stockpile, borrow areas, operations camp, and transmission line. The gold and silver will be recovered into a gold-silver doré product and shipped by air and/or transported by road. Electrical power will be supplied by a new approximately 135 km, 230 kilovolt (kV) overland transmission line that will connect to the BC Hydro grid at the Glenannan substation located near the Endako mine, 65 km west of Vanderhoof.

Fugitive dust is the primary source of air emissions and can be associated with the major mine components, section 4.0 identifies potential air emission sources.

For a more comprehensive review of the proposed mine site operation and infrastructure, refer to the Air Quality and Fugitive Dust Management Plan (AQFDMP) provided in Appendix A, Section 5.3.

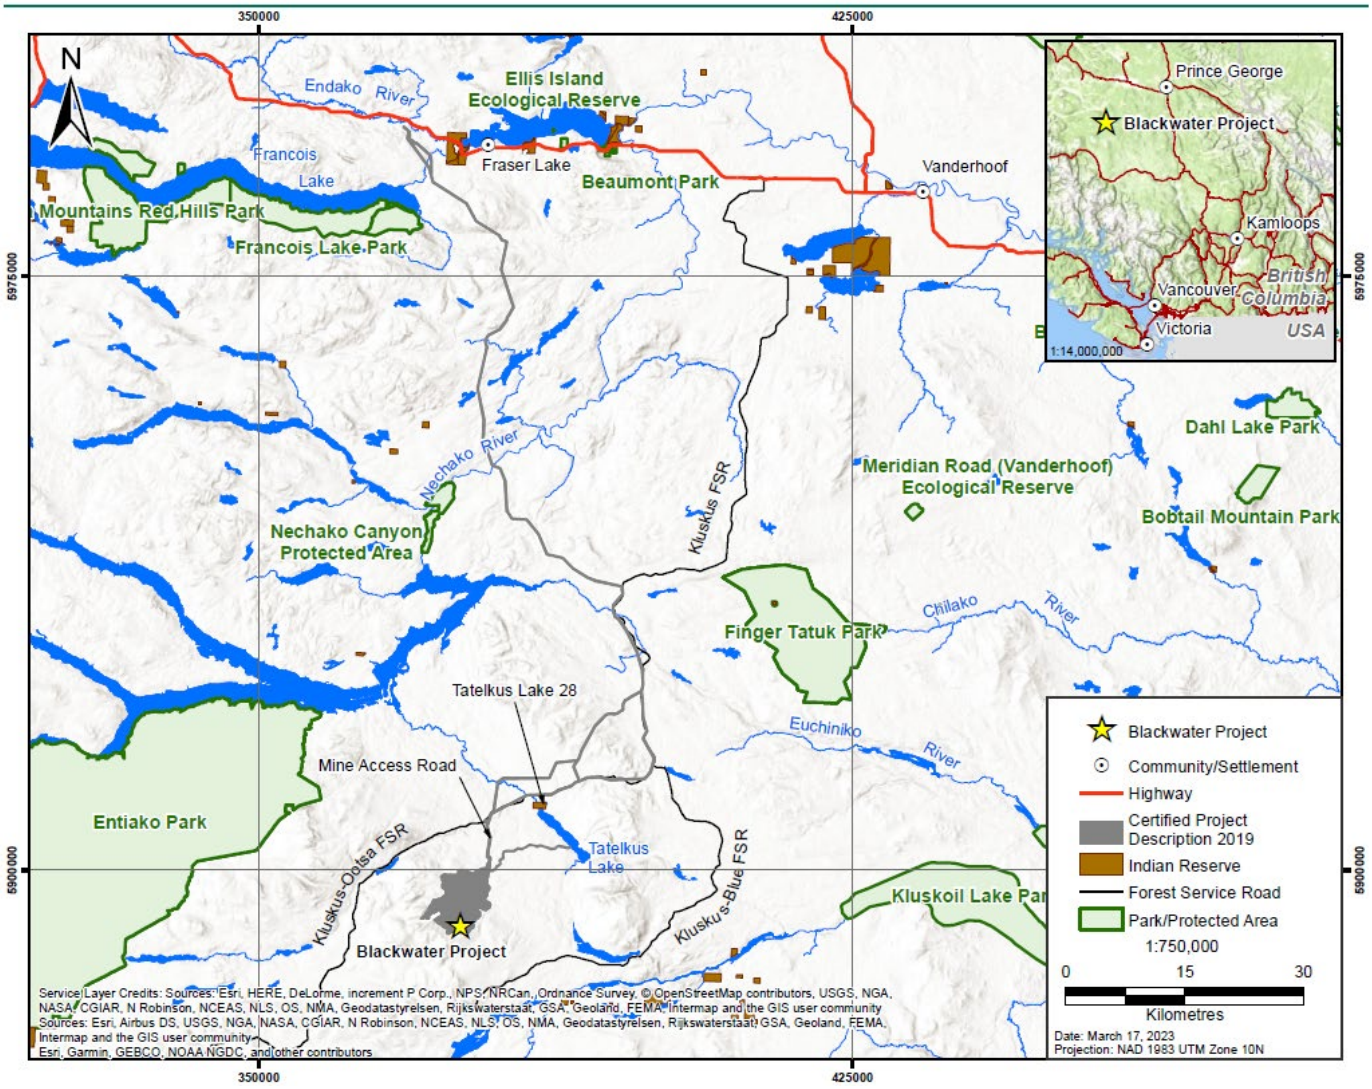

Figure 1 Blackwater Project Location

2 Purpose and Scope

The purpose of the 2023 Annual Monitoring Report for Air Quality and Fugitive Dust Management is to provide a summary of:

- Environmental incidents and complaints,
- All monitoring under permits,
- An assessment of the data; and,
- Recommendations as appropriate.

This report also conforms to the requirements outlined in Developing a Fugitive Dust Management Plan for Mines in BC (BC EMLI & ENV, 2023) and EAO Condition 3 which require that adaptive management be used to evaluate the effectiveness and direct continual improvement of the AQFDMP. The AQFDMP was developed for and submitted with BWG's Joint Application for Mines Act/ Environmental Management Act permits. It addresses the requirements of EAC #M19-01 Condition 20 and federal Decision Statement (DS) Conditions 6.1, 6.3, 6.12 and 6.15.

Additionally, this report identifies measures taken to minimize the effects of the Project's air emissions on human health and the natural environment. The scope of work conducted was in accordance with the

AQFDMP provided in Appendix A. The AQFDMP identifies the Project's fugitive dust-emitting sources and mitigation and contingency measures in the event that primary control measures are not effectively controlling dust emissions.

The intent of this report is to comply with the AQFDMP's annual reporting requirements.

2.1 Existing Permits

BWG has a permitted diesel-fired putrescible waste incinerator (Environmental Management Act Authorization #106530, the Authorization), which is located near the construction camp. The Authorization allows a maximum discharge rate of 110 m^3/minute and maximum waste feed of 1.1 tonnes/day. Authorized waste for incineration includes putrescible camp waste, paper, cardboard, and lumber scraps that cannot be recycled. Condition 2.1.3 of the Authorization requires that every effort be made to minimize incineration of plastics. BWG did not use the incinerator onsite in 2023 as waste was disposed of in an alternate manner (i.e., taken off-site for disposal). On December 8, 2023, a trial run was conducted to ensure that the incinerator was in good working condition. During the trial run, less than 20 kg of waste cardboard and wood were burned for less than an hour.

In May 2023 the Mine received Environmental Management Act Permit 110650 (PE-110650, dated May 2, 2023). This permit authorizes the discharge of air contaminants to the atmosphere from the mine, subject to a number of requirements. No operations occurred in 2023 as construction of the Mine progressed, a list of mine components in construction is provided in Section 1.2.

2.2 Exclusions

Consistent with the Guidance (BC EMLI & ENV, 2023), the AQFDMP does not address occupational health and safety requirements pertaining to workplace exposures to dust. Worker health and safety at mine sites is regulated by the Health, Safety and Reclamation Code for Mines in British Columbia (EMLI 2022). The Project's Occupational Health and Safety Program is discussed in Chapter 8 of the Application (BWG Project Joint Application for a Mines Act and Environmental Management Act Permits).

2.3 Related Documents

Environmental Assessment Certificate (EAC) Condition 20 requires the AQFDMP to indicate how the AQFDMP informs the Country Foods Monitoring Plan (CFMP, EAC Condition 41) and the Wildlife Mitigation and Monitoring Plan (WMMP, EAC Condition 23). Fugitive dust deposition monitoring is not recommended by the Ministry of Environment and Climate Change Strategy (ENV) for the purposes of wildlife and human health protection (ENV 2020) and is not included in the AQFDMP. However, as required by EAC Condition 41, analysis of dust for metal concentrations was monitored for the CFMP and data collected can be used to inform the WMMP.

Monitoring of trace element (metals) uptake in vegetation and soils is considered in the Reclamation and Closure Plan and the CFMP. Plant tissue can be affected by the deposition of dust (particulate matter) containing metals generated by Mine activities. Plants can also accumulate metals from the soil through uptake of metals through the root. Monitoring under the CFMP will determine whether concentrations of metals have changed in soil or in vegetation tissue because of the Mine. The results of trace metals monitoring and potential implications for wildlife based on results from monitoring under the CFMP will be addressed through WMMP reporting.

Results of the AQFDMP for monitoring of particulate matter (PM, Section 6.4), nitrogen dioxide (NO_2), and sulfur dioxide (SO_2; Section 6.5) will inform the CFMP. As such, results of the CFMP Dustfall

monitoring (Section 4.2, CFMP) will inform this AQFDMP report.

2.4 Davidson Creek Fire

An on-site wildfire started on July 10th, Davidson Creek (File Number: G41493[1]), and grew to 4,879 hectares in size, burning approximately 60% of the mine site. BWG evacuated all employees on July 9th with a gradual return to site starting the week of July 24th. Construction activities fully recommenced on August 3rd.

On July 13, 2023, BWG provided notifications to regulators, including ENV, and First Nations to highlight the potential for missed sampling events during this time. With regards to PE-110650, the sampling events missed due to this event was Carbon Monoxide (CO) Monitoring between July 9th and August 2nd, 2023, as well as a radiello sample was deployed on July 1st with the expectation it would be retrieved on July 10th. However, due to the evacuation of the mine the sample was not retrieved until August 15, 2023.

Additionally, following this event it was observed that the current Fugitive Dust Trigger Response Plan (TRP) does not support adequate delineation between fire impacts and mine impacts to PM. As a result, BWG reported several non-compliance to ENV and First Nations that were likely caused by smoke from those fires as opposed to activities on the mine site. As a learning from these events the AQDMP and TRP will be updated to reduce reporting during smoke events. This update will be made by a Qualified Professional.

As monitoring continues through future years, trends that may be associated with the 2023 Davidson Creek Wildfire will be noted.

3 Regulatory Objectives and Standards

The Canadian Environmental Protection Act, 1999 establishes National Ambient Air Quality Objectives (NAAQOs) and Canadian Ambient Air Quality Standards (CAAQS) to protect human health and the environment. BC has established Ambient Air Quality Objectives (AAQOs) pursuant to the Environmental Management Act. Federal and BC air quality objectives are provided in Table 3-1 and are non-legally binding limits. As even low levels of air pollution can affect some individuals, air quality objectives should not be viewed as levels that can be ‘polluted up to’, but levels to stay well below.

[1] BC Wildfire Service https://wildfiresituation.nrs.gov.bc.ca/list

Table 3-1 Canadian and BC Ambient Quality Objectives

Contaminants	Averaging Period	Objectives and Standards	
		BCAAQO [a]	**CAAQS** [b]
PM_{10}	24-Hour	50	-
$PM_{2.5}$	24-Hour	25 [c]	27 [d]
	Annual	8 [e]	8.8 [f]
CO	1-hour	14,300	-
	8-hour	5,500	-
NO_2	1-hour	188 [g]	113 [h]
	Annual	60 [i]	32[j]
SO_2	1-hour	-	183 [k]
	Annual	13 [l]	-

Notes:

µg/m³ = micrograms per cubic metre; PM_{10} = Particulate matter less than 10 µm (microns) in diameter; $PM_{2.5}$ = Particulate matter less than 2.5 µm (microns) in diameter; CO = carbon monoxide; NO_2 = nitrogen dioxide; SO_2 = sulphur dioxide

"-" signifies no air quality objective is available.

[a] BC Ambient Air Quality Objectives.

[b] Canadian Ambient Air Quality Standards.

[c] Achieved based on annual 98th percentile of daily average, over one year.

[d] Achieved based on 98th percentile of daily average, averaged over three consecutive years.

[e] Achievement based on annual average, over on year. There is a planning goal of 6 µg/m³.

[f] Achievement based on annual average, averaged over three consecutive years.

[g] Interim provincial AAQO, currently under review. Achievement based on annual 98th percentile of D1HM, over one- year.

[h] Achievement based on annual 98th percentile of D1HM, averaged over three consecutive years.

[i] Interim provincial AQO, currently under review.

[j] compliance based on a one-calendar-year average of all the 1-hour average concentrations.

[k] Achievement based on annual 99th percentile of D1HM, averaged over three consecutive years, effective January 1, 2020.

[l] Used to inform new air management decisions beginning January 2017 and all air management decisions beginning January 1, 2020.

4 Identification of Air Emission Sources

Fugitive dust is the primary source of air emissions. Potential dust sources include material handling/ re-handling, construction and use of unpaved roads, blasting, compaction, drilling, grading, material (including ore) loading and unloading, and ore processing. Erodible surface areas such as stockpiles and the TSF beach) are also sources of fugitive dust.

In 2023 the following activities were conducted at the mine site that may have resulted in the emissions of fugitive dust:

- Land clearing and earthworks for the construction camp and plant site.
- Construction and use of unpaved access and mine roads.
- Material handling/re-handling at aggregate and topsoil stockpiles.
- Parking lot and road grading.
- Construction of water management structures (e.g., diversion channels)
- Aggregate extraction from borrow pits.
- Borrow and Aggregate Crushing and Screening; and
- Concrete Batch Plant operations.

Table 4-1 provides further detail on dust emissions by Project component.

Table 4-1 Fugitive Dust Emission Sources by Project Component

Component	Potential Source	Dust-generating Material	Generating Conditions
Concrete Batch Plant	Material handling	Cement, aggregate	Any conditions
Aggregate screening areas	Material handling / rehandling, vehicle traffic	Aggregate	Windy, dry, hot days or extremely cold days
Borrow Areas	Material handling / rehandling, vehicle traffic	Overburden, waste rock and aggregate	Windy, dry, hot days or extremely cold days
Topsoil stockpiles	Wind erosion, material handling, vehicle traffic	Topsoil	Wind, dry, hot days, or extremely cold weather
Upper and Lower Waste stockpiles	Wind erosion, material handling, vehicle traffic	Overburden and waste rock	Windy, dry, hot days, or extremely cold weather
Service roads	Vehicles traffic, grading	Aggregate	Any conditions

Component	Potential Source	Dust-generating Material	Generating Conditions
Mine access road	Vehicle traffic, grading	Aggregate	Wind, dry, hot days, or extremely cold weather
TSF, mine site haul and service roads	Vehicle traffic, grading	Aggregate	Any conditions

Non-dust air emission sources include mine fleet exhaust (multiple), backup diesel generators (multiple), and the existing diesel-fired putrescible waste incinerator.

Once construction ends and the mine is operating, more activities will be present that could potentially result in fugitive dust. The AQFDMP further discusses the activities resulting in fugitive dust by Project Phase and Project Components (Section 6.0, Appendix A).

5 Fugitive Dust Management

Activities in 2023 that could have resulted in emissions of fugitive dust (non-point source emissions) included the following:

- Land clearing and earthworks for the construction camp and plant site;
- Construction and use of unpaved access and mine roads;
- Material handling/re-handling at aggregate and topsoil stockpiles;
- Parking lot and road grading;
- Construction of water management structures (e.g., diversion channels);
- Aggregate extraction from borrow pits;
- Borrow and aggregate crushing and screening; and
- Concrete Batch Plant.

5.1 Implementation

The following sections present the mitigation measures, training, and monitoring that was implemented in 2023 to manage fugitive dust and to help assess if mitigation measures are working.

5.1.1 Mitigation Measures

Site-specific mitigation measures, including best management practices, were applied to all active dust sources. Table 5-1 which is condensed to show only activities that occurred in 2023. For a full list of emission sources please refer to Section 8.2 of the AQFDMP (Appendix A).

Table 5-1 Air Quality Mitigation Measures, Best Management Practices, and Contingency

Emission Source	Best Management and Mitigation Measures
Concrete batch plant	• When unloading material, piles should form low piles (target height of approximately 10 m) that extend horizontally, where practical. • Employees involved in material handling or management will receive instruction by a qualified person on the importance of minimizing material drop height (from excavator to truck, conveyor to stockpile, etc.) to reduce fugitive dust, noise and vibration.
Aggregate crushing and screen areas	• Equip the crusher and/or screener circuits with onboard water dosing during times of the year above freezing temperatures or other dust suppression measures (e.g., reagents) systems. • Apply water when temperatures are above freezing and there are very dry conditions (less than 0.25 mm/day of precipitation in the previous week). • Stockpiles should form low piles (targe height of approximately 10 m) that extend horizontally as determined by the Construction Manager, where practical. • Use screener and crusher covers. • Check cover for tears, holes, and cracks on a monthly basis. Repair as soon as possible.
Borrow areas	• Apply water when temperatures are above freezing and there are very dry conditions (less than 0.25 mm/day or precipitation in the previous week). • Employees involved in material handling or management will receive instruction by a qualified person on the importance of minimizing material drop height (from excavator to truck conveyor to stockpile, etc.) to reduce fugitive dust, noise, vibration. • Develop new borrow areas only when and as required (to be determined by the Mine Manager). • Once suitable materials have been salvaged, place topsoil on disturbed areas and seed once they are sloped to final grade and at an appropriate time of year for seeding using a native seed mix to re-establish vegetative cover as soon as reasonably possible. • When unloading material, piles should form low piles (target height of approximately 10 m) that extend horizontally. • Minimize drop height from loaders and excavators (shovels) to the truck.
Topsoil Stockpiles	• When unloading material, the piles should form low piles that extend horizontally. • Seed stockpiles to reduce erosion and establishment of invasive species.
MAR	• Speed limits will be established based on road design class, with the maximum speed limit of 50 km/hr on all Project roads. • Reduce speed limits on Project-owned roads if weather conditions cause fugitive dust emissions and dust cannot be controlled by watering. • Speed limits are clearly marked through signage and enforced by site security through periodic checks using a radar speed gun. Personnel caught speeding will face disciplinary measures, and if violators are encountered, they will be provided with constructive instructions on the importance of adhering to speed limits to limit dust generation. • Manage dust emissions from roadways in accordance with the Fugitive Dust Management SOP. • Water roads in accordance with Section 5.1.1 (watering) of the Fugitive Dust Management Plan. • Apply dust suppressant reagents after spring melt (e.g., calcium chloride, magnesium chloride or other equivalent) as approved by the Mine Manager. • Grader maintenance with road crush as required. • Regular compaction. • Use coarse aggregate on roads with low silt content to reduce silt loading on roads.
TSF and mine haulage and service roads	• Speed limits will be established based on road design class, with the maximum speed limit of 50 km/hr on all Project roads. • Reduce speed limits on Project-owned roads if weather conditions cause fugitive dust emissions and dust cannot be controlled by watering. • Speed limits are clearly marked through signage and enforced by site security Personnel caught speeding may face disciplinary measures and if violators are encountered, they will be provided with constructive instruction on the importance of adhering to speed limits to limit dust generation. • Manage dust emissions from roadways in accordance with the Fugitive Dust Management Plan. • Visual inspections for dust emissions for roadways and active stockpiles – mine and infrastructure supervisors, or designate, as well as the mine dispatch office who have a number of real-time stationary but rotating cameras with multiple angles of the open pit and haul roads will monitor for visible emissions from the truck equipment, and active stockpiles on the site during moderate weather conditions. A hot, dry day is defined as a day with less than 0.25 mm of rainfall for the preceding 24 hours and a temperature greater than 20°C. • Utilize available fleet of water trucks, weather depending (non-freezing conditions) • Apply dust suppressant reagents after spring melt (e.g., calcium chloride, magnesium chloride or other equivalent) as approved by the Mine Manager. • Use coarse aggregate on roads with low silt content to reduce silt loading on roads. • Grader maintenance with road crush as required. • Regular compaction.
Vehicles	• Maintain equipment in good working condition according to manufacturer’s recommendations. • Restrict speeds and reducing idling. • Use Tier IV engines for mine fleet.

Water trucks were utilized on site to help supress fugitive dust emissions that may occur due to active trucks on the roadway and site construction. Water trucks were active between the months of May and October 2023, no calcium chloride was used at the Mine. Each water truck load holds approximately 20,000 L (20 m^3) of water. Table 5-2 below shows the number of water truck loads per month and estimated water used. Figure 2 below shows in red the route the water truck would take.

Table 5-2 Fugitive Dust Suppression

Truck No	**May**	**June**	**July**	**August**	**September**	**October**
	Number of Loads per Month					
982	8	151	39	139	129	55
988	45	97	55	126	84	5
991	0	8	20	110	56	0
Total Per Month	**53**	**256**	**114**	**375**	**269**	**60**
Estimated Volume of Water (m^3)	**1,060**	**5,120**	**2,280**	**7,500**	**5,380**	**1,200**

The Kode Borrow pit has installed spray bars to help with dust suppression. These spray bars are used as needed to suppress emissions of fugitive dust.

It's proposed that future plans for dust suppression at the TSF Esker incorporate the use of a dust suppression product similar to Envirobind, which is a biologically based modified asphalt emulsion that is specifically made for dust control.

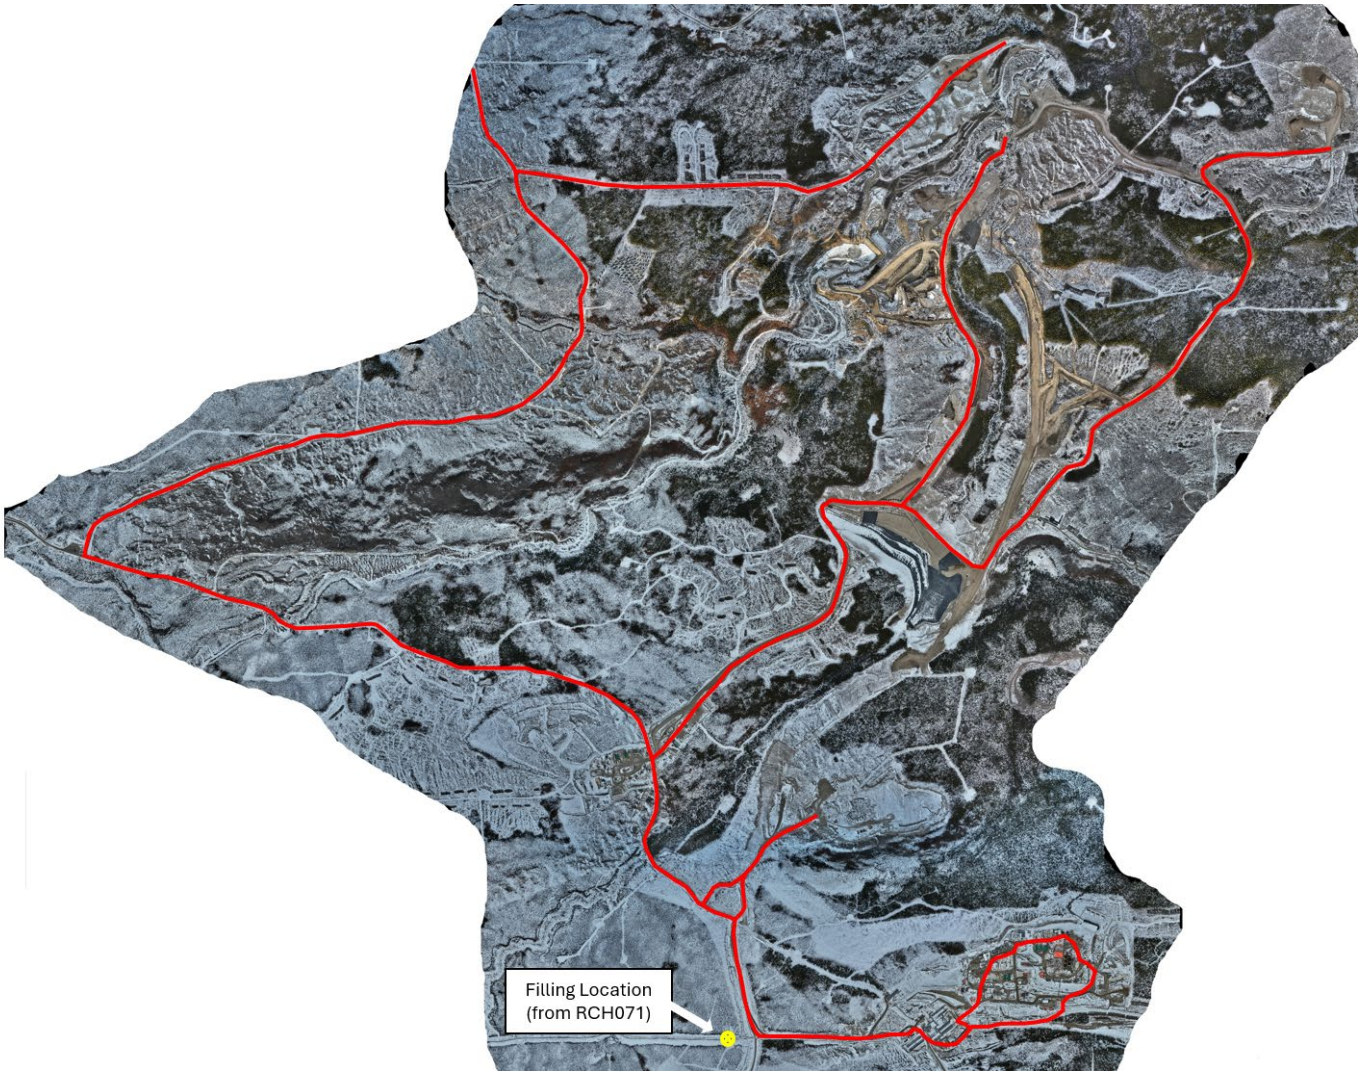

Figure 2 Water Truck Route

5.1.2 Training and Awareness

As part of the environmental on-boarding training session and Site Orientation, employees and contractors receiving training in fugitive dust management and air quality awareness upon arrive to site.

In August 2023, the Mine Environmental Department reviewed the *Fugitive Dust Management Plan Standard Operating Procedure* with the Earthworks Supervisors.

The purpose of training is to provide site personnel with a basic level of environmental awareness and an understanding of their obligations regarding compliance with regulatory requirements, commitments, and best practices. Targeted training related to dust management is provided to individuals and/or groups of workers assuming a specific authority or responsibility related to air quality.

BWG reviews and updates the training and awareness plan based on changes in training needs and regulatory requirements.

5.1.3 On-site Partisol Training

In November 2023 BWG Environment employees received a hands-on training provided by a qualified professional from CD Nova (Vancouver, BC), on the Thermo Scientific Partisol-FRM Model 2025i-D PM sampler (Partisol) and particulate matter sampling. The training covered:

- Reviewing Partisol machine parts, components, mechanisms, and functions.
- Reviewed owners manual and standard operating procedure.
- Disassembly of parts, cleaning process and reassembly.
- Reviewed standard maintenance and cleaning intervals.
- Calibration intervals and processes, including temperature, humidity, pressure, leak and flow testing.
- Installation of filter cassettes and magazines for regular sampling.
- Partisol Machine menu operation, procedures for setting sampling schedule.
- Reviewed Partisol Machine location and provided feedback for new location.

6 Monitoring

6.1 Point Source Discharge Monitoring

Point source discharge monitoring was not done in 2023, as the sources of discharge (e.g. crushers, furnaces, etc.) and the associated baghouse and dust suppression systems have not been constructed at the Mine.

6.2 Meteorological Stations

There are two existing, automated meteorological stations (Figure 3). Photos 6.2.1 and 6.2-2 of the Meteorological stations are provided below. Table 6-1 provides information on the locations, parameters measured, and the available period of data. Table 6-2 includes a list of the types of monitors at each station and sampling frequency.

The stations consist of a 10 m high tower with sensors, data logger and power supply. A Campbell Scientific CR1000 data logger is installed at each station and data are collected at hourly intervals for the following parameters:

- Average air temperature;
- Average humidity;
- Average wind speed and direction;
- Average snow depth;
- Total precipitation (solid and liquid);
- Average solar radiation;
- Average net radiation; and
- Average barometric pressure

Data, continuously collected by the units, is downloaded following procedures in the *Climate Station Operational and Quality Assurance Plan*. Data is reviewed according to guidance in *Water and Air Baseline Guidance Document for Mine Proponents and Operators* (BC MOE 2016c).

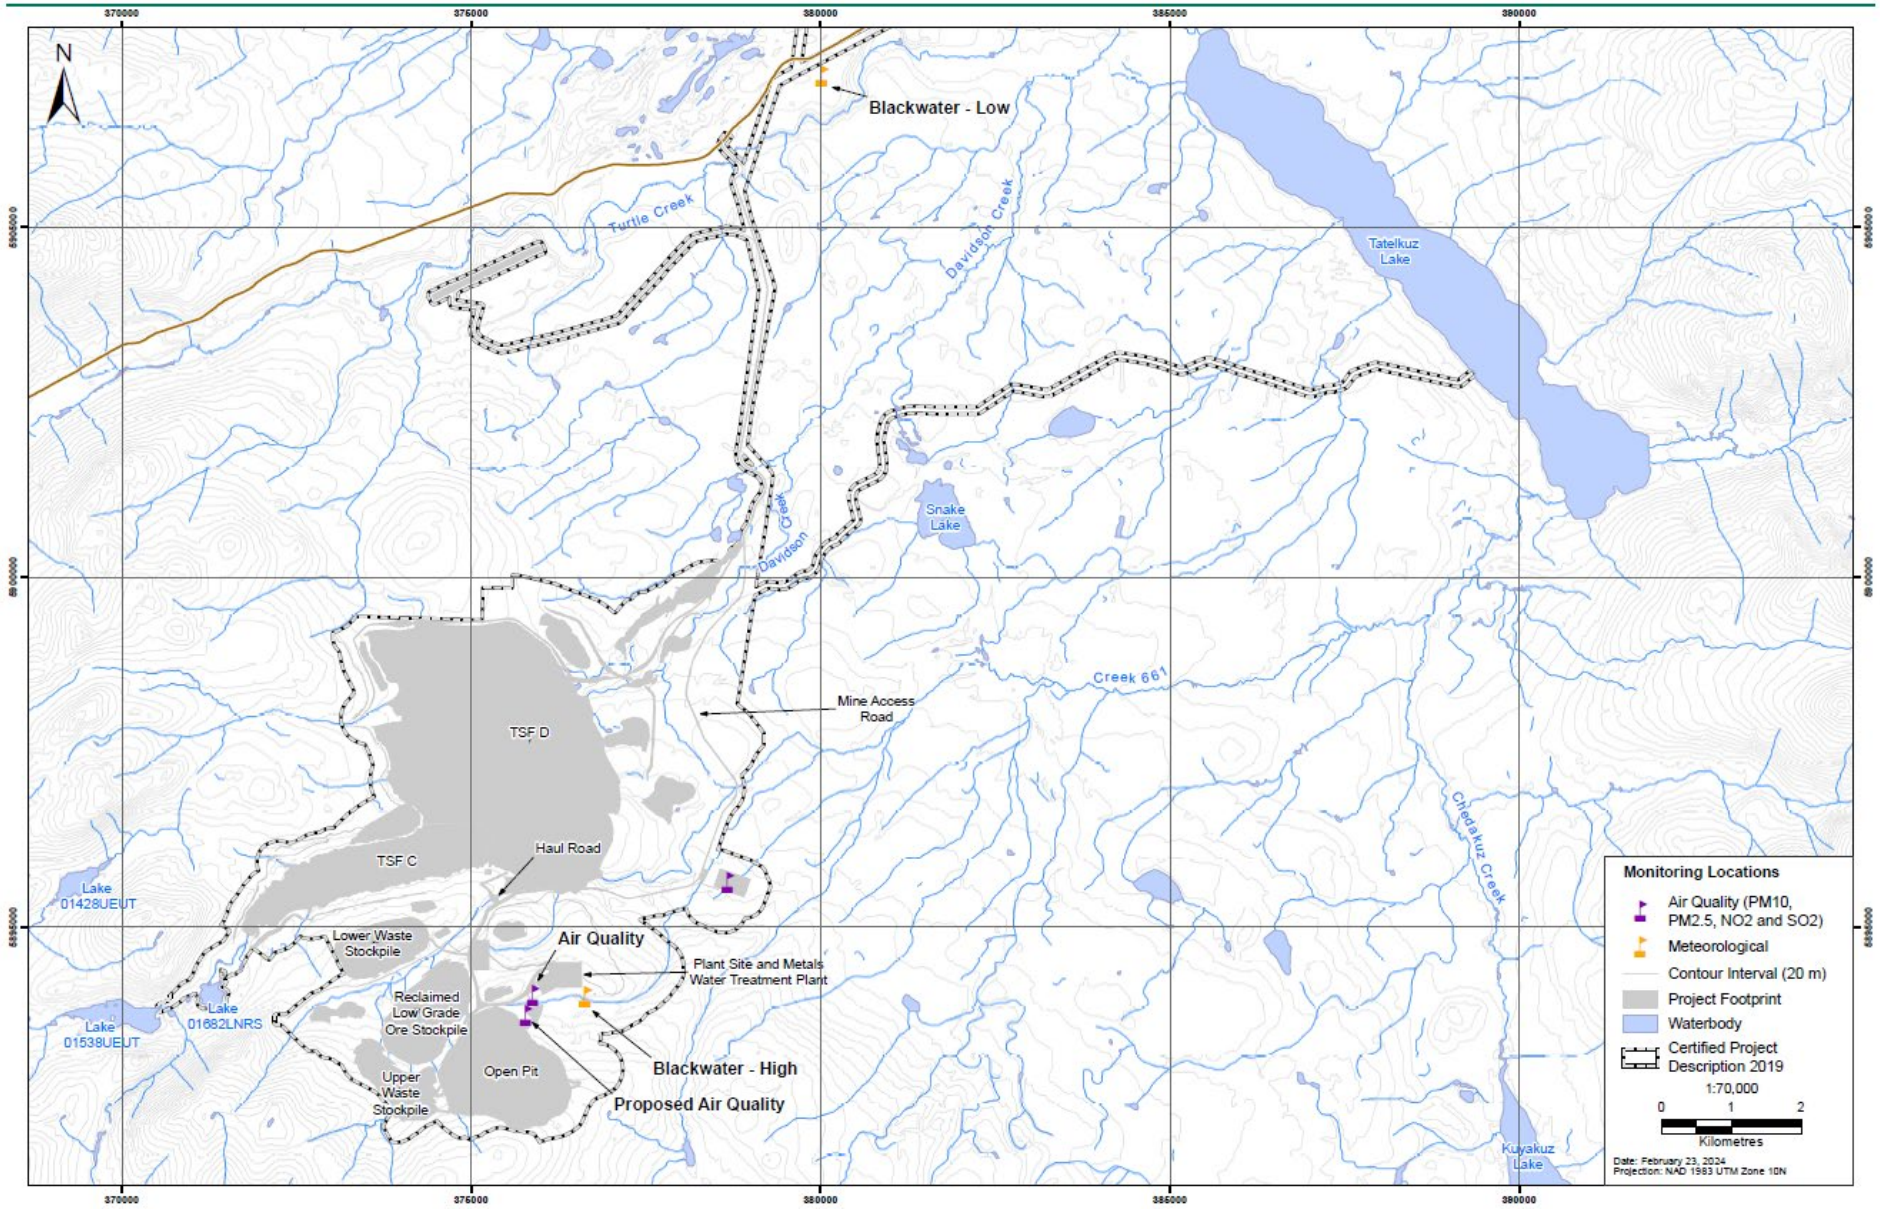

Figure 3 Air Quality Monitoring Locations

Photo 6.2-2 BWG Low Station, Taken October 18, 2023

Table 6-1 BWG Project Meteorological Stations

Station Name	Station Height	Latitude (deg N)	Longitude (deg W)	Elevation (masl)	Meteorological Parameters Monitored	Data Period Available
Low	10 m	53.29979	124.80025	1,050	Air temperature, relative humidity, precipitation, wind speed and direction, barometric pressure, snow depth, net radiation, solar radiation	August 2011 - present
High	10 m	53.18113	124.84620	1,470	Air temperature, relative humidity, precipitation, wind speed and direction, barometric pressure, snow depth, net radiation, solar radiation	July 2012 - present

Table 6-2 Climate Station Monitored Parameters

Instrument	Type	Parameter Measured	Measurement Method	Data Calculation Method
Campbell Scientific SR50A 4941	Sonic Distance Sensor	Snow Depth	Look-down ultrasonic pulse sensor secured on a cross-arm measuring the distance to the surface of the snowpack	Hourly mean
R. M. Young 05103-10 122245	Wind Monitor	Wind (speed, direction, hourly standard deviation of direction)	Vane anemometer mounted 10 m above ground	Hourly mean for wind speed and direction
Vaisala CS106 H1950060	Barometer	Barometric Pressure	Silicon capacitive sensor housed inside the data logger enclosure	Hourly mean
Vaisala HMP 155 G3860033	Humidity and Temperature Probe	Air temperature and relative humidity	Temperature and humidity probe mounted 4 m above ground with a multi-plate passive solar radiation shield	Hourly mean
Ott Pluvio 302172	Precipitation Gauge	Precipitation	Weighing rain gauge outfitted with a single alter windshield	Hourly sum
Kipp & Zonen NR Lit 103766	Radiometer	Net radiation	Radiometer	Hourly mean
Kipp & Zonen SP Lite2 126157	Pyranometer	Solar radiation	Pyranometer	Hourly mean

6.2.1 Results

Knight Piesold Ltd. (KP) has provided technical support for the climate monitoring network for BWG since early 2011. An annual letter summarizing the continuous monitoring of meteorological parameters title *2023 Meteorological Monitoring Program Review* is included in Appendix B. The letter is intended to certify compliance with Section 5.2 and to satisfy the climatological portions of Section 6.1 h) and j) of this Air Discharge Permit.

A summary of the results presented in the Letter is provided below.

The Permit requires valid data for 90% of the hours in each calendar quarter, for continuously monitored parameters. This requirement was met for all parameters with an annual data availability of at least 99.8%. The table below breaks down the data availability per quarter Table 6-3.

Table 6-3 Annual and Quarterly Total Data Availability

Parameter	BWG High and Low Combined Daily Data Availability				
	Annual	Q1	Q2	Q3	Q4
Wind Speed	99.8%	99.7%	100%	100%	99.6%
Wind Direction	99.8%	99.7%	100%	100%	99.6%
Wind Direction Standard Deviation	99.8%	99.7%	100%	100%	99.6%
Air Temperature	99.9%	100%	100%	100%	99.6%
Precipitation	99.9%	100%	100%	100%	99.6%
Solar Radiation	99.9%	100%	100%	100%	99.6%
Rel. Humidity	99.9%	100%	100%	100%	99.6%

During 2023, the climate transitioned from La Niña to El Niño conditions, World Meteorological Organization (WMO) declared the onset of El Niño in early July, but the transition at site occurred a little earlier around spring 2023. Temperatures were mostly below the long-term average in the first quarter of the year, and then rising to stay above average for the remainder of the year.

The 2023 air temperature and precipitation were compared to the long-term temperature and precipitation series (41 years, 1980 – 2020) presented in Hydrometeorology Report (KP, 2021)[2]. The BWG High station mean annual temperature (MAT) of 3.3°C was 1.3°C warmer than the long-term MAT of 2.0°C. At the BWG Low station, the 2023 MAT was 5.0°C, 1.8°C warmer than the long-term MAT of 3.2°C. Table 6-4 provides the mine air temperature in 2023 with comparison to Long-term Estimates

[2] Knight Piesold Ltd. (KP), 2021. Blackwater Gold Project – 2020 Hydrometeorology Report. May 17. Vancouver, BC. Ref. No. VA101-457/33-, Rev1

Table 6-4 Mine Air Temperature in 2023 with Comparison to Long-term Estimates

Station / Parameter	Value	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sept	Oct	Nov	Dec	Annual
BWG Low Air Temperature (°C)	Long-term Max	-2.7	-0.4	2.3	6.8	12.3	14.1	16.1	15.7	11.8	6.0	0.2	-2.0	4.8
	Long-term Min	-16.0	-14.9	-6.7	0.8	6.2	9.3	12.0	10.8	6.2	0.8	-13.5	-16.2	0.8
	Long-term Average	-7.7	-5.6	-1.1	3.7	8.6	11.6	13.7	13.3	9.1	3.6	-2.8	-7.5	3.2
	Year 2023	-3.3	-4.8	-3.7	2.5	12.5	13.8	14.4	15.1	10.2	4.4	-0.1	-1.9	5.0
	Year 2023 Deviation from LT-Average	+4.5	+0.8	-2.6	-1.2	+3.9	+2.2	+0.8	+1.8	+1.1	+0.7	+2.7	+5.6	+1.8
BWG High Air Temperature (°C)	Long-term Max	-1.3	-1.4	1.1	4.4	9.8	11.4	13.6	13.7	10.5	4.3	-0.2	-2.6	3.2
	Long-term Min	-14.7	-15.4	-7.6	-0.8	4.5	7.1	9.5	8.6	3.8	-0.3	-12.5	-14.9	-0.2
	Long-term Average	-7.3	-5.9	-2.1	2.1	6.5	9.1	11.0	10.7	7.0	2.3	-3.2	-7.3	2.0
	Year 2023	-3.4	-7.0	-5.7	-0.2	10.2	11.1	12.4	13.1	8.3	3.6	-1.0	-2.3	3.3
	Year 2023 Deviation from LT-Average	+3.8	-1.1	-3.6	-2.3	+3.8	+2.0	+1.4	+2.3	+1.2	+1.3	+2.2	+5.0	+1.3

Notes:

1. Grey shaded values indicate months with more than 5 missing observations that required infilling based on correlations with values from the other station.
2. The Mine's primary monitoring station is BW High, with BW Low serving as a redundancy station.
3. Underline 2023 values indicate a new maximum compared to the long-term record (1980-2020).

The annual precipitation at the BWG High station was 512 mm, 86% of the long-term mean annual precipitation (MAP) of 595 mm. At the BWG Low station, the 2023 annual precipitation of 361 mm was 73% of the long-term MAP of 495 mm. The relatively low precipitation at the BWG Low site may have been at least partially due to the estimation of missing data. On July 16, 2023, the most precipitation was seen at the BWG High station with 23.02 mm recorded in 24-hours. This value is raw data values before the application of an under-catch factor. The monthly and annual precipitation for 2023 and long-term estimates are shown in Table 6-5.

Table 6-5 Monthly and Annual Precipitation - 2023 and Long-term Estimates

Station / Parameter	Value	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sept	Oct	Nov	Dec	Annual
BWG Low Total Precipitation (mm)	Long-term Max	128	98	62	70	86	155	156	134	9	146	122	79	657
	Long-term Min	11	5	1	4	7	15	11	2	7	6	12	7	345
	Long-term Average	41	28	24	28	38	59	56	46	44	54	42	37	495
	Year 2023	**34**	**34**	**24**	**28**	**14**	**27**	**72**	**39**	**13**	**20**	**24**	**32**	**361**
	Year 2023 as Percentage of LT-Average	83%	121%	100%	99%	36%	46%	129%	83%	30%	37%	58%	86%	73%
BWG High Total Precipitation (mm)	Long-term Max	164	106	65	79	100	177	178	153	103	175	120	101	779
	Long-term Min	14	6	2	4	8	17	12	9	10	18	15	10	408
	Long-term Average	51	35	30	33	44	68	64	52	51	65	56	47	595
	Year 2023	**46**	**73**	**29**	**33**	**19**	**45**	**91**	**32**	**23**	**31**	**51**	**38**	**512**
	Year 2023 as Percentage of LT-Average	90%	209%	97%	100%	44%	67%	143%	61%	46%	48%	91%	81%	86%

Notes:

1. Grey shaded values indicated months with more than 5 missing observations. These values were estimated by orographically adjusting the concurrent values from the BWG High station.
2. The Mine's primary monitoring station is BWG High, with the BWG Low station serving as a back-up station.

Manual snow surveys followed the sampling schedule of the regional snow survey conducted by the BC government. Regional snow survey and automatic snow pillow stations suggest that the snowpack conditions in 2023 at elevation 1,490 m (similar elevation to BWG High) was close to historical normal, with the peak Snow Water Equivalent (SWE) occurring in late April and snowpack disappearing by the end of May. Typically snow surveys at the mine were conducted monthly January to May; however, in early Q2 of 2023, the transition to the major mine permits and associated regulatory changes led to uncertainties in scope approval and temporary interruptions of site visits. Measurements were completed in January and February and May 2023 after the snow at the survey stations had melted. No survey data is available for April and May 2023.

Table 6-6 2023 Snow Course Survey Measurements

Snow Course	Date	Ave. Snow Depth (cm)	Ave. Snow Water Equivalent (cm)	Ave. Snow Density (%)
SS1	2023-01-04	59	11.6	20
	2023-02-23	97	20.0	21
SS2	2023-01-04	31	5.6	18
	2023-03-01	50	9.2	18
S3	2023-01-05	39	6.2	16
	2023-03-01	46	10.4	23

6.2.2 Quality Assurance and Quality Control

The meteorological stations follow the Station Operational and Quality Assurance Plan (KP, 2023) as required by PE-110650.

Instruments should be calibrated according to the manufacturer's recommended calibration schedule or if maintenance indicates the need to calibrate earlier. In general, the manufacturer's specifications for the operation and maintenance of monitoring instruments are followed.

No sensors required calibration in 2023, as they were all previously calibrated in summer 2022. Validation measurements are taken during field visits, to confirm the sensor is capturing accurate and precise data. The substantial difference between the temperature validation field measurements and the logger measurement at BWG Low is not believed to be indicated of a logger error, as BWG Low's air temperature and humidity time series did not indicate a systematic sensor error, and it is speculated that the noted difference is likely due to sun exposure to the handheld measurement device being exposed to sun while the station's sensor is housed inside a radiation shield.

Visual inspections were completed by Avison Management Services (Avison) at the BWG Low station on February 23, June 8, July 4, August 1, September 8, and October 18, 2023, and at the BWG High Station on January 5, 18 and 23, February 17, May 8, July 4, August 1, October 26, and December 21, 2023. Avison inspects the instruments, probes and cables for any damage or corrosion, as well as removes any shrubs or tress starting to grow in the area to keep the areas clear for quality data collection. Avison documents site visits using KP's online database. That database tracks equipment changes, maintenance, and basic site visits.

Cable damage occurred at BWG Low station resulting in missing air temperature, radiation, and relative humidity, between May – June 2, 2023. A sensor malfunction resulted in no precipitation monitoring between May 2 and 11, 2023.

In August 2023, the two climate stations were each upgraded with telemetry modem, which added real-time weather monitoring capability to the Mine. This upgrade significantly improved response times to sensor malfunction and repair. Additionally, accessing real-time weather data via an interactive dashboard improves the Mine's site operation and management planning.

6.3 Dustfall Monitoring

Although dustfall monitoring and the dustfall Pollution Control Objectives have outdated methodology and are no longer recommended by BC ENV (2020), dustfall samples were collected from eight locations in September of 2023 and are presented in ERM (2024) *"CFMP Annual Report 2023"* provided in Appendix C.

For full discussion and comparison of dustfall and particulate matter refer to CFMP (ERM 2024), the following summarizes information taken from the CFMP (ERM 2024)

Dustfall collectors were deployed from September 3 to 8, 2023. ERM's sampling crew deployed five out of eight dustfall containers, while the remaining three dustfall containers were set up by the BWG environmental team. Four dustfall stations were located in the near-field area at sites CFMP-SV-004, -006, -014, and -019; and four sites were located in the control area at sites CFMP-SV-024, -027, -032, and -040. Site 004 had been affected by the July 2023 wildfire, but dust collectors were set up after fire activity had ceased and it was safe for crews to enter the area. Table 6-7 lists the location and site classification.

Table 6-7 2023 Dustfall Sampling Sites

Site ID	UTM Coordinates		Site Classification	
	Easting	Northing	Near-Field (Impact)	Control
CFMP-SV-004	371485	5896139	X	
CFMP-SV-006	374417	5891796	X	
CFMP-SV-014	379289	5898605	X	
CFMP-SV-019	377967	5900722	X	
CFMP-SV-024	375822	5907513		X
CFMP-SV-027	386022	5902891		X
CFMP-SV-032	368437	5880920		X
CFMP-SV-040	388451	5905960		X

Impact sites (CFMP-004, -006, -014, and 019) were sampled for dustfall for 23 to 24 days, and control sites (CFMP-024, -027, -032, and -040) were sampled for 12 to 21 days. The deviation to sampling is discussed in the CFMP Annual Report (ERM 2024).

6.3.1 Results

Summary statistics for total dustfall and dustfall metal amounts for contaminant of potential concern (COPCs) at impact and control sites and in the CFMP study area overall are shown in Table 6-8 and Table 6-9 provides the site-wide results.

Mean total dustfall amount at impact sites was 4.34 mg, whereas total dustfall was not detectable at any of the control sites. Only aluminum, iron, lead, and manganese were sufficiently (>30% of samples) detectable in dustfall to calculate summary statistics. Three out of four impact sites had detectable levels of iron and lead, whereas lead was not detectable at control sites and iron was only detectable in one of the four control sites. Zinc was detectable at one impact site. Concentrations of COPCs overall were low.

Table 6-8 Summary Statistics for Total Dustfall and Dustfall Metals COPCS, 2023

Parameter or COPC	Total Dustfall and Dustfall Metal Amounts, Near-field Sites (n = 4)				Total Dustfall and Dustfall Metal Amounts, Control Sites (n = 4)			
	n > DL	Minimum (mg)	Mean (mg)	Maximum (mg)	n > DL	Minimum (mg)	Mean (mg)	Maximum (mg)

Zinc	1	<0.0015	-	-	-	-	-	-	0.00400

Notes:
COPC = contaminant of potential concern; n = number of samples; DL = detection limit; UCLM = upper confidence limit of the mean
"<" = concentration is less than the detection limit.
"-" means that summary statistics, other than minimum and maximum, have not been calculated as more than 70% of samples were below DL.
For the purpose of calculating summary statistics, non-detectable concentrations were assumed to be 0.5 x DL.
Impact (near-field) sites are CFMP-SV-004, -006, -014, and -019, and control sites are CFMP-SV-024, -027, -032, and -040,

6.4 Particulate Matter Monitoring

A Thermo Scientific Partisol FRM Model 2025i D PM sampler (Partisol) was installed in October 2022. Monitoring of PM by the Partisol began on May 9, 2023. The location of the Partisol was recommended by an Air Quality QP and is centred at 5894019 N and 375894 E (UTM Zone 10 NAD83). The Partisol was installed near the existing exploration camp, between Dorm block A and the maintenance shop (see Figure 3 Air Quality Monitoring Locations).

However, following a review of those results presented below it was noted that the presence of a wood burning furnace (used periodically until the end of May 2023), and the increase in infrastructure was impacting the monitoring results. Based on this a QP has recommended that the Partisol be moved to a new location. To support this recommendation BWG is pursuing an amendment to PE-110650 to relocate the unit. The revised location is still situated near the Construction Camp at 5893835N and 375871 E, however it is further away from busy unpaved roads and building structures.

The Partisol will stay at this new location until the Operations camp is complete.

6.4.1 Sampling Methodology

BWG personnel collected particulate matter samples in general accordance with ENV's *British Columbia Field Sampling Manual* (2013).

PM samples were collected directly from laboratory supplied filtered cassettes. The Partisol measures PM < 10 microns (PM_{10}) and PM < 2.5 microns ($PM_{2.5}$) mass concentrations on a 47 mm filter contained in a single-action filter change mechanism. Samples were collected over a 24-hour period at a target flow rate of 1m^3/hr.

The following procedure were completed for cassette deployment and retrieval.

- The PM cassette filters are prepped by ALS Environmental Laboratory (ALS) accredited by Canadian Association for Laboratory Accreditation (CALA) and returned to BWG for deployment.
- BWG loads received cassette filters into the Partisol, inputting individual filter numbers to associate filters with sampling information.
- Sample schedules are set following National Air Pollution Surveillance (NAPS) sampling schedule. During the months of May to October, fine particulate sampling occurs every third day, simultaneously for $PM_{2.5}$ and PM_{10}. During November to April, sampling occurs on a weekly basis simultaneously for $PM_{2.5}$ and $PM_{10.}$
- Cassettes were retrieved on a weekly basis, recording field notes (date, weather, time) as well as sample information such as Volume (m^3) and total sample run time (HH:mm).
- All samples were stored in coolers and transported under chain of custody protocol to ALS for analysis.

6.4.2 Results

The 2023 particulate matter monitoring results are summarized in Table 6-10 Summary of 2023 May to December Partisol Results, and laboratory certificates of analysis are attached in Appendix D. Monitoring results are compared to TRP and applicable standard and objectives.

$PM_{2.5}$ exceeded the value of the BCAAQO 9 times between May and December 2023. A true $PM_{2.5}$ exceedance of the BCAAQO is based on the 98th percentile of 24-hour measurements. This metric cannot

be calculated in 2023 as there was not a 75% data completeness for $PM_{2.5}$ in 2023. PM_{10} exceeded the BCAAQO 12 times between May and December 2023. The highest concentration of $PM_{2.5}$ (192 ug/m^3) and PM_{10} (278 ug/m^3) were both observed on August 28, 2023. Table 6-11 Particulate Matter Exceedances outlines the date of exceedances, parameter which exceeded, and a rationale. Table 6-10 Summary of 2023 May to December Partisol Results also shows the May to December average 24-hour concentration for PM_{10} (37.0 ug/m^3) and $PM_{2.5}$ (15.4 ug/m^3) and data completeness based on the total number of possible samples that were planned on being taken between May and December.

a- achieved based on annual 98th percentile value.
b- achieved based on 98th percentile of daily average, averaged over three consecutive years.
Where concentrations were below the detection limit, half the detection limit was used for the calculation.
* - Two June 14, 2023, samples were recorded; however, impossible. The second June 14,2023 was sampled between June 14 and July 2, but the date is unknown.

6.4.3 Non-Compliance Results

Between May and December 2023, PM monitoring experienced 16 $PM_{2.5}$ and 16 PM_{10} exceedances when compared to PE-110650 and TRP trigger levels. The predicted root causes for the exceedances were construction activities, maintenance shop's wood burning furnace[3], and wildfire smoke from regional and onsite fires. A list of the exceedances is presented below. The dates of the Non-compliance submissions to the director were: August 14, September 13, October 5, October 18, December 5, 2023.

[3] The wood burning furnace was used to burn untreated wood for warmth in the Maintenance shop. The furnace was decommissioned in May 2023.

Table 6-11 Particulate Matter Exceedances

Date	Trigger / Exceedance	Root Cause of Non-Compliance	Remedial Action
May 18, 2023	PM_{10}, High Level Permit Exceedance	Nearby Construction and Maintenance Shop Wood Burning Furnace	Construction was completed and Maintenance shop wood burning furnace was locked out.
May 21, 2023	$PM_{2.5}$ and PM_{10}, High Level Permit Exceedance	Nearby Construction and Maintenance Shop Wood Burning Furnace	Construction was completed and Maintenance shop wood burning furnace was locked out.
May 24, 2023	PM_{10}, High Level Permit Exceedance	Nearby Construction and Maintenance Shop Wood Burning Furnace	Construction was completed and Maintenance shop wood burning furnace was locked out.
June 2, 2023	PM_{10}, High Level Permit Exceedance	Nearby Construction and Maintenance Shop Wood Burning Furnace	Construction was completed and Maintenance shop wood burning furnace was locked out.
June 5, 2023	PM_{10}, High Level Permit Exceedance	Nearby Construction and Maintenance Shop Wood Burning Furnace	Construction was completed and Maintenance shop wood burning furnace was locked out.
June 11, 2023	PM_{10}, High Level Permit Exceedance	Nearby Construction and Maintenance Shop Wood Burning Furnace	Construction was completed and Maintenance shop wood burning furnace was locked out.
July 8, 2023	$PM_{2.5}$ and PM_{10}, High Level Permit Exceedance	Nearby and local wildfires	BWG Industrial Hygienist commenced daily particulate monitoring using a handheld Particulate Plus, Model #7301.
July 14, 2023	$PM_{2.5}$ High Level Permit Exceedance and PM_{10} Medium Level	Nearby and local wildfires	BWG Industrial Hygienist commenced daily particulate monitoring using a handheld Particulate Plus, Model #7301.
July 23, 2023	$PM_{2.5}$ High Level Permit Exceedance and PM_{10} Medium Level	Nearby and local wildfires	BWG Industrial Hygienist commenced daily particulate monitoring using a handheld Particulate Plus, Model #7301.
Aug 19, 2023	$PM_{2.5}$ Low Level and PM_{10} Medium Level Exceedance	Nearby and local wildfires	BWG Industrial Hygienist commenced daily particulate monitoring using a handheld Particulate Plus, Model #7301.
Aug 22, 2023	$PM_{2.5}$ and PM_{10}, High Level Permit Exceedance	Nearby and local wildfires	BWG Industrial Hygienist commenced daily particulate monitoring using a handheld Particulate Plus, Model #7301.
Aug 25, 2023	$PM_{2.5}$ High Level Permit Exceedance and PM_{10} Medium Level	Nearby and local wildfires	BWG Industrial Hygienist commenced daily particulate monitoring using a handheld Particulate Plus, Model #7301.
August 28, 2023	$PM_{2.5}$ and PM_{10}, High Level Permit Exceedance	Nearby and local wildfires	BWG Industrial Hygienist commenced daily particulate monitoring using a handheld Particulate Plus, Model #7301.
Aug 31, 2023	$PM_{2.5}$ Low Level	Nearby and local wildfires	BWG Industrial Hygienist commenced daily particulate monitoring using a handheld Particulate Plus, Model #7301.
Sept 3, 2023	$PM_{2.5}$ and PM_{10}, High Level Permit Exceedance	Nearby and local wildfires	BWG Industrial Hygienist commenced daily particulate monitoring using a handheld Particulate Plus, Model #7301.
Sept 15, 2023	$PM_{2.5}$ and PM_{10}, High Level Permit Exceedance	Nearby and local wildfires, as well as gusty wind conditions	BWG Industrial Hygienist commenced daily particulate monitoring using a handheld Particulate Plus, Model #7301. As well water trucks are deployed on dry and dusty days.
Sept 21, 2023	PM_{10} Medium Level	Fugitive dust possibly from site activities and nearby vehicle movement on unpaved ground as well as contribution from wildfire smoke.	Water trucks run daily to prevent fugitive dust that may occur on roadways or due to construction activities.
November 20, 2023	PM_{10}, High Level Permit Exceedance	Entrained dust due to gusty wind conditions	Freezing temperatures at site and snow cover

6.4.4 Quality Assurance and Quality Control

The quality assurance and quality control (QA/QC) program implemented during this monitoring period was to confirm that representative samples were collected, and representative laboratory results were reported. BWG followed the listed procedure for the QA/QC program:

- Recorded field notes during each deployment and retrieval of the Partisol magazines.
- Samples submitted to ALS using an accurately filled out Chain of Custody.
- Employees received hands on training provided by CD Nova.
- Samples submitted to ALS are subjected to laboratory QA/QC procedures (i.e., method blanks, laboratory control samples, lab duplicates, etc.), which are documented in the laboratory Certificate of Analysis (COA) provided in Appendix D. No laboratory outliers for method blanks, duplicates, test sample surrogate recovery, reference material sample, quality control sample frequency, or holding time were identified during 2023.

6.5 Nitrogen Dioxide and Sulfur Dioxide Monitoring

BWG personnel collected passive air sample system (PASS) in general accordance with ENV's *British Columbia Field Sampling Manual* (2023).

The radiello apparatus was installed by BWG staff in 2023 at the same location as the Partisol. The deployment duration of the Radiello was in general accordance with BC ENV Standard Operating Procedure 7 Passive Sampling (2018) between 24-hours and 30 days. It is recommended in the User Manual 2019 Radiello[4] provided by ALS that 15-days or less was most ideal, as long as relative humidity was less than 70% for the entire sampling duration or advisable to sample up to 7-days if humidity is over 70%. It was decided that radiello would be deployed for roughly 7-days to avoid any possibility of high humidity biased samples.

During deployment and retrieval of the sorbet tube radiello a visual inspection is completed on the structure of the apparatus, checking for any abnormalities of the apparatus and influences on the Radiello. No calibration is required as the sorbet tubes are supplied by ALS and are of one-time use.

In total 23 samples were collected in 2023, with the highest SO_2 concentration of 0.23 parts per billion (ppb, June 18, 2023) and the highest NO_2 concentration of 4.9 ppb (Dec 19, 2023). As radiello samples are collected over a 7-day period, comparison to the CAAQS hourly NO_2 and SO_2 concentrations is not comparable. Results of the radiello were compared to the average annual standards. Table 3-1 in Section 3 above provides the objectives and standards for 1-hour concentrations. The annual average concentration of NO_2 and SO_2 were below the BACAAQO and CAAQS.

A website is used to convert the ppb units into ug/m3 to use against the Canadian objectives. Laboratory Certificates of Analysis are provided in Appendix E.

6.5.1 Results

The results of the radiello SO_2 and NO_2 samples are provided in the Table 6-11 2023 May to December Radiello Concentrations.

Annual Average Concentration					1.57	0.23

Notes:
sources: British Columbia Ministry of Environment and Climate Change Strategy (BCAAQO, 2023) and Canadian Ambient Air Quality Standards (CAAQS, 2013)

The sample collected on Aug 15, 2023, was unintentionally deployed for 45 days due to the Davidson Creek wildfire. The sorbet tube was deployed on July 1st with the expectation it would be retrieved by July 10th; however, the Mine was evacuated on July 10th, 2023.

6.5.2 Quality Assurance and Quality Control

A standards QA/QC program was implemented during this assessment to ensure representative samples were collected and that representative analytical data were reported by the laboratory. The following outlines BWG personnel's procedures for the QA/QC program:

- Recorded field notes during the deployment and retrieval of the radiello;
- Samples were submitted using a completed COC.
- Submitted one field duplicate for laboratory analysis for 10% of samples collected.

Duplicate sample analysis ensures laboratory quality control as well as reproducibility of field sampling procedures.

The reproducibility of field sampling techniques is quantified by a parameter referred to as the relative percent difference (RPD). RPD is calculated using the following formula:

$$RPD = \frac{\mathrm{S} - \mathrm{D}}{0.5(\mathrm{S} + \mathrm{D})}\ x\ 100\%$$

Where: RPD = relative percent difference

S = sample value

D = duplicate value

Analytical error generally increases near the method reporting limit or lowest detection limit; therefore, the RPD calculation should not be applied unless the concentration of both samples is greater than five times the detection limit[5]. The analysis of the duplicate samples were not calculable (due to concentrations less than five times the detection limit) or non-detect, suggesting the sample and duplicate results are reproducible and reliable.

Table 6-13 Radiello QAQC Results

Sample ID	Lowest Detection Limit	RAD1	RAD1 DUP	Relative Percent Difference	RAD1	RAD1 DUP	Relative Percent Difference	RAD1	RAD1 DUP	Relative Percent Difference
Sample Date		11-Sep-2023			17-Oct-2023			19-Dec-2023		
Nitrogen Dioxide (ppb)	1	2.2	1.9	NA	<0.72	<0.72	NC	4.9	4.8	NA
Sulphur Dioxide (ppb)	1	<0.24	<0.24	NC	<0.22	<0.22	NC	<0.21	<0.21	NC
Nitrogen Dioxide (ug/m^3)	1	4.138	3.574	NA	<1.354	<1.354	NC	9.217	9.029	2.06%
Sulphur Dioxide (ug/m^3)	1	<0.629	<0.629	NC	<0.576	<0.576	NC	<0.550	<0.550	NC

Notes:
NC – Not calculable (due to concentrations less than five times the detection limit)
NA – Not Applicable

Samples submitted to ALS are subjected to laboratory QA/QC procedures (i.e., method blanks, laboratory control samples, lab duplicates, surrogate recoveries, and reference materials), which are documented in the laboratory COA provided in Appendix E. No outliers were noted for the 2023 data.

It was noted COA VA23C9505 (December 5th) sample arrived at Burnaby ALS in good condition; however, during the transfer to Cincinnati, USA the sample container broke. The sample was run for routine analysis and did not appear to be compromise as analytical results were similar to previously reported.

[5] ENV *British Columbia Field Sampling Manual* (2023).

6.6 Carbon Monoxide

BWG staff conducted CO monitoring once a week using a handheld MSA Altair 4XR gas monitoring. On average, at least 3 locations that appeared to be susceptible to high CO emissions were monitored with the handheld away from running trucks or other gas exhausts. These locations were chosen instead of collecting CO measurements at the PASS location due to equipment unavailability. The handheld monitor used completes an auto calibration before ever use to ensure accurate readings. The Environmental Monitor at each location will stand for 45 – 60 seconds or until the reading stabilizes prior to recording the measurement.

6.6.1 Results

Table 6-14 shows all the CO monitoring events for 2023.

Annual Average Concentration[d]		0.18
Maximum Concentration		9

Although not directly comparable to the BCAAQO which require either 1-hour or 8-hour averages, none of the CO Monitoring events exceeded the value of the 1-hour BCAAQO in 2023. The highest CO concentration of 9 ppm was observed on May 13, 2023, at the Maintenance Shop. The annual average of all CO monitoring events was 0.18 ppm.

No CO monitoring was conducted between July 9 to August 2, 2023, as the Mine was evacuated due to the Davidson Creek Wildfire.

7 Community Feedback Mechanism

Pursuant to DS Condition 6.3, BWG has established a feedback mechanism to manage input and complaints related to exposure to dust from the Project during construction, operation, and decommissioning. Complaints may arise from Project-related use of the FSRs between Vanderhoof and the Project site. Monitoring activities will include a review of any complaints received from the public related to fugitive dust and air quality and an initial response within 48 hours. Complaints will be carefully investigated, tracked and logged, contributing factors that may have resulted in the complaint, and any actions that were undertaken and follow-up to address the complaint. Complaints may require a more in-depth root cause analysis and result in modification of the Plan.

As of writing this report no complaints specific to dust and/or air quality have been received by BWG.

8 Summary

The 2023 Annual Monitoring Report for Air Quality and Fugitive Dust Management provides a summary of environmental incidents and complaints, all monitoring under permits, an assessment of the monitoring data, and recommendations as appropriate. Monitoring was conducted and data analyzed to identify potential air quality concerns at the mine site. Based on the sampling and analytical program findings, the following summary of activities onsite and monitoring is provided:

- In 2023 the following activities were conducted at the mine site that may have resulted in the emissions of fugitive dust:
    - Land clearing and earthworks for the construction camp and plant site.
    - Construction and use of unpaved access and mine roads.
    - Material handling/re-handling at aggregate and topsoil stockpiles.
    - Parking lot and road grading.
    - Construction of water management structures (e.g., diversion channels)
    - Aggregate extraction from borrow pits.
    - Borrow and Aggregate Crushing and Screening; and
    - Concrete Batch Plant operations.
- A range of mitigation measures were applied to limit the emissions of fugitive dust, including the use of water trucks, spray bars, inspections, and compaction.
- An on-site wildfire started on July 10th, Davidson Creek (File Number: G41493), and grew to 4,808 hectares in size, burning approximately 60% of the mine site. BWG evacuated all employees on July 9th with a gradual return to site starting the week of July 24th. Construction activities fully recommenced on August 3rd.
- The BWG High station mean annual temperature was 3.3°C and the BWG Low station was 5.0°C. The annual precipitation at the BWG High station was 512 mm and 361 mm at the BWG Low station in 2023. In August 2023, the two climate stations were each upgraded with telemetry modem, which added real-time weather monitoring capability to the Mine. This upgrade significantly improved response times to sensor malfunction and repair. Additionally, accessing

real-time weather data via an interactive dashboard improves the Mine's site operation and management planning. Meteorological data was collected between January and December 2023.

- No point source discharges occurred in 2023.
- As part of the CFMP dustfall collectors were deployed from September 3 to 8, 2023. ERM's sampling crew deployed five out of eight dustfall containers, while the remaining three dustfall containers were set up by the BWG environmental team. Four dustfall stations were located in the near-field area at sites CFMP-SV-004, -006, -014, and -019; and four sites were located in the control area at sites CFMP-SV-024, -027, -032, and -040. Mean total dustfall amount at impact sites was 4.34 mg, whereas total dustfall was not detectable at any of the control sites. Only aluminum, iron, lead, and manganese were sufficiently (>30% of samples) detectable in dustfall to calculate summary statistics. Three out of four impact sites had detectable levels of iron and lead, whereas lead was not detectable at control sites and iron was only detectable in one of the four control sites. Zinc was detectable at one impact site. Concentrations of COPCs overall were low.
- $PM_{2.5}$ exceeded the value of the 24-hour BCAAQO 9 times between May and December 2023. A true $PM_{2.5}$ exceedance of the BCAAQO is based on the 98th percentile of 24-hour measurements. This metric cannot be calculated in 2023 as there was not a 75% data completeness for $PM_{2.5}$ in 2023. PM_{10} exceeded the 24- hour BCAAQO 12 times between May and December 2023. The highest concentration of $PM_{2.5}$ (192 ug/m^3) and PM_{10} (278 ug/m^3) were both observed on August 28, 2023. Elevated PM concentrations were attributed to the maintenance shop wood burning furnace, exploration camp expansion construction, as well as local and regional wildfires during the summer months and strong wind gusts with entrained wind.
- In total 23 radiello samples were collected in 2023, with the highest SO_2 concentration of 0.23 ppb (June 18, 2023) and the highest NO_2 concentration of 4.9 ppb (Dec 19, 2023). The annual average concentration of NO_2 and SO_2 were below the BACAAQO and CAAQS average annual standards.
- Although not directly comparable to the BCAAQO which require either 1-hour or 8-hour averages, none of the CO monitoring events exceeded the value of the 1-hour BCAAQO in 2023. The highest CO concentration of 9 ppm was observed on May 13, 2023, at the Maintenance Shop. The annual average of all CO monitoring events was 0.18 ppm. No CO monitoring was conducted between July 9 to August 2, 2023, as the Mine was evacuated due to the Davidson Creek Wildfire.

9 Recommendations

As part of the requirements of the AQFDMP and TRP a fugitive dust trigger-action-response-plan (TARP) table was developed. The TARP for the AQFDMP differs slightly from the TARP in the TRP due to specific requirements outlined in PE-110650 that was issued after the completion of the AQFDMP. Both the AQFDMP and TRP are required to undergo an annual review. Part of that review involves making recommendations for any updates to the plans.

The first recommended update to the AQFDMP is to align the TARP in Section 9.1 of the AQFDMP with the TARP in the TRP so that there is consistency across both management plans.

The second recommended update is to adjust the TARP so that it allows for distinguishing between air quality triggers that are a result of activity at the Mine versus triggers that are a result of regional effects such as wildfires. In 2023 there was significant wildfire activity both at the Mine as well as across British Columbia that affected air quality measured at the Mine (see Section 1.3). Currently Level 2 and 3 triggers for $PM_{2.5}$ and PM_{10} readings at the Partisol require notification and supporting information be provided to the BC ENV Director. BWG is proposing to alter the TARP to only require notification to the

BC ENV Director when the Level 2 and 3 triggers related to the Partisol are a result of Mine activities and not regional effects such as wildfires. Table 9-1 Fugitive Dust Trigger Action Response below provides an updated TARP that will replace the current TARP in both the AQFDMP and the TRP.

To determine if a Level 2 or 3 trigger for $PM_{2.5}$ and PM_{10} is a result of non-Mine related activity BWG will review data from regional air quality stations at Vanderhoof Court House and Quesnel Johnson Avenue, operated by ENV, and from wildfire related $PM_{2.5}$ modelling at firesmoke.ca. By looking at the data listed above and from onsite meteorology it will be determined if a true Level 2 or Level 3 trigger did occur. No other changes to the TARP are recommended.

In addition, as discussed in Section 8.3, BWG is currently looking to update PE-110650 to move the location of the Partisol to better measure overall air quality at the Mine and not be as influenced by emissions sources that are very close to the Partisol.

Table 9-1 Fugitive Dust Trigger Action Response

Component	Location	Permit Limit	Level	Trigger	Management Response	Documentation, and People and Parties to Notify
Fugitive Dust (TSP)	Unpaved Roads	Indeterminant[1]	None	Dust plume less than half the height of a haul truck tire.	No action. Continue work in accordance with site management procedures.	No action.
			Level 1, Low	Dust plume less than half the size of a haul truck for any period of time up to 30 minutes.	Limited watering of high traffic areas. Repeat visual inspection every 2 hours depending on weather.	Immediately report to Departmental Manager.
			Level 2, Medium	Dust plume same size as a haul truck extending beyond local area for periods longer than half a day.	Continuous watering of high traffic areas until dust plume subsides. Speed limit restrictions in high traffic areas.	Immediately report to Departmental Manager, Environmental Manager, Mine Manager and Qualified Professional. Immediately provide email notification and supporting information to the BC ENV Director[2]: envauthorizationsreporting@gov.bc.ca. After inspections are complete, a log of the findings will be filled out by the Departmental Manager.
			Level 3, High	Dust plume greater than the size of a haul truck for periods longer than 1 day, or when dust plumes extend beyond the active mine area/infrastructure.	Increase frequency of watering and if not successful examine longer use of alternative dust suppressants (e.g., calcium or magnesium chloride, lignin compounds, environmentally friendly oils or clay additives). Speed limit restrictions may be required if dust cannot be controlled by watering. Closure of certain routes may be required if dust cannot be controlled by watering or speed restrictions.	Immediately report to Departmental Manager, Environmental Manager, Mine Manager and Qualified Professional. Immediately provide email notification and supporting information to the BC ENV Director[2]: envauthorizationsreporting@gov.bc.ca. Notify Indigenous Nations. After inspections are complete, a log of the findings will be filled out by the Departmental Manager.
	Surface Earthworks	Indeterminant[1]	None	Minor localized dust (dust plumes that are less than 2 m in height) during construction and normal mine operations.	No action. Continue work in accordance with site management procedures.	No action.
			Level 1, Low	Visible dust plumes rising over 2 m above the active construction area for longer than 30 minutes.	Minimize material movement in areas with active construction or operation and heavy equipment use.	Immediately report to Departmental Manager.
			Level 2, Medium	Triggers per level 1 but with dust plume extending beyond local area for periods longer than half a day.	Application of water to exposed construction area (if this is a source).	Immediately report to Departmental Manager, Environmental Manager, Mine Manager and Qualified Professional. Immediately provide email notification and supporting information to the BC ENV Director[2]: envauthorizationsreporting@gov.bc.ca. After inspections are complete, a log of the findings will be filled out by the Departmental Manager.
			Level 3, High	Extensive areas of dust generation with large dust plumes for periods longer than 1 day or when dust plumes extend beyond the active mine area/ infrastructure.	Increase frequency of watering and if not successful apply gravel to exposed construction area (if this is a source). Investigate long term solutions if dust plumes persist.	Immediately report to Departmental Manager, Environmental Manager, Mine Manager and Qualified Professional. Immediately provide email notification and supporting information to the BC ENV Director[2]: envauthorizationsreporting@gov.bc.ca. Notify Indigenous Nations After inspections are complete, a log of the findings will be filled out by the Departmental Manager.
Fugitive Dust (TSP) *(cont'd)*	Stockpiles	Indeterminant[1]	None	Minor localized dust (dust plumes that are less than 2 m in height) during construction and normal mine operations.	No action. Continue work in accordance with site management procedures.	No action.

Component	Location	Permit Limit	Level	Trigger	Management Response	Documentation, and People and Parties to Notify
			Level 1, Low	Visible dust plumes rising over 2 m above the ground for longer than 30 minutes.	Turn on spray bar sprinklers[5]. During periods where temperatures are below freezing add reagents to control dust.	Immediately report to Departmental Manager.
			Level 2, Medium	Triggers per level 1 but with dust plume extending beyond local area for periods longer than half a day.	Increase the rate of water application using spray bar sprinklers[5]. During periods where temperatures are consistently below freezing, add reagents to control dust.	Immediately report to Departmental Manager, Environmental Manager, Mine Manager and Qualified Professional. Immediately provide email notification and supporting information to the BC ENV Director[2]: envauthorizationsreporting@gov.bc.ca. After inspections are complete, a log of the findings will be filled out by the Departmental Manager.
			Level 3, High	Extensive areas of dust generation with large dust plumes for periods longer than 1 day or when dust plumes extend beyond the active mine area/infrastructure.	Examine the possibility of re engineering the spray bar sprinklers[5] to provide more effective water coverage of transfer points.	Immediately report to Departmental Manager, Environmental Manager, Mine Manager and Qualified Professional. Immediately provide email notification and supporting information to the BC ENV Director[2]: envauthorizationsreporting@gov.bc.ca. Notify Indigenous Nations. After inspections are complete, a log of the findings will be filled out by the Departmental Manager.
	Material handling transfer locations	Indeterminant[1]	None	Minor localized dust (dust plumes that are less than 2 m in height) during construction and normal mine operations.	No action. Continue work in accordance with site management procedures.	No action.
			Level 1, Low	Visible dust plumes rising over 2 m above the ground for longer than 30 minutes.	Turn on spray bar sprinklers[5]. During periods where temperature are below freezing add reagents to control dust.	Immediately report to Departmental Manager.
			Level 2, Medium	Triggers per level 1 but with dust plume extending beyond local area for periods longer than half a day.	Increase the rate of water application using spray bar sprinklers. During periods where temperature are below freezing, add reagents to control dust.	Immediately report to Departmental Manager, Environmental Manager, Mine Manager and Qualified Professional. Immediately provide email notification and supporting information to the BC ENV Director[2]: envauthorizationsreporting@gov.bc.ca. After inspections are complete, a log of the findings will be filled out by the Departmental Manager.
			Level 3, High	Extensive areas of dust generation with large dust plumes for periods longer than 1 day or when dust plumes extend beyond the active mine area/infrastructure.	Examine the possibility of re engineering the spray bar sprinklers to provide more effective water coverage of transfer points.	Immediately report to Departmental Manager, Environmental Manager, Mine Manager and Qualified Professional. Immediately provide email notification and supporting information to the BC ENV Director[2]: envauthorizationsreporting@gov.bc.ca. Notify Indigenous Nations. After inspections are complete, a log of the findings will be filled out by the Departmental Manager.
PM_{10} and $PM_{2.5}$	Operations Camp	PM_{10} (24-hour average): 50 µg/m^3 $PM_{2.5}$ (24-hour average): 25 µg/m^3	None	The PM_{10} and $PM_{2.5}$ concentration at the Operations Camp is less than or equal to 50% of the Ambient Air Quality Objective[4], or less than or equal to the baseline value. PM_{10} (24-hour average): ≤25 µg/m^3 $PM_{2.5}$ (24-hour average): ≤12.5 µg/m^3 $PM_{2.5}$ (annual average): ≤4 µg/m^3	No action. Continue monitoring.	No action.

Component	Location	Permit Limit	Level	Trigger	Management Response	Documentation, and People and Parties to Notify
		$PM_{2.5}$ (annual average): 8 µg/m^3	Level 1, Low	The PM_{10} and $PM_{2.5}$ concentration at the Operations Camp is greater than 50% but less than or equal to 80% of the Ambient Air Quality Objective[4], and is above the baseline value, and the site air quality is not influenced by wildfire smoke[6]. PM_{10} (24-hour average): >34 and ≤40 µg/m^3 $PM_{2.5}$ (24-hour average): >12.5 and ≤20 µg/m^3 $PM_{2.5}$ (annual average): >4 and ≤6.4 µg/m^3	Continue monitoring. Develop causal analysis and associated mitigations in addition to a schedule for implementation.	Immediately report to Departmental Manager.
			Level 2, Medium	The PM_{10} and $PM_{2.5}$ concentration is greater than 80% but less than or equal to 100% of the Ambient Air Quality Objective[4], and the site air quality is not influenced by wildfire smoke[6]. PM_{10} (24-hour average): >40 and ≤50 µg/m^3 $PM_{2.5}$ (24-hour average): >20 and ≤25 µg/m^3 $PM_{2.5}$ (annual average): >6.4 and ≤8 µg/m^3	Continue monitoring. Develop causal analysis and associated mitigations in addition to a schedule for implementation. Implement mitigations developed at the low action level.	Immediately report to Departmental Manager, Environmental Manager, Mine Manager and Qualified Professional. Immediately provide email notification and supporting information to the BC ENV Director[2]: envauthorizationsreporting@gov.bc.ca. After inspections are complete, a log of the findings will be filled out by the Departmental Manager.
			Level 3, High	The PM_{10} and $PM_{2.5}$ concentration is greater than the Ambient Air Quality Objective[4], and the site air quality is not influenced by wildfire smoke[6]. PM_{10} (24-hour average): >50 µg/m^3 $PM_{2.5}$ (24-hour average): >25 µg/m^3 $PM_{2.5}$ (annual average): >8 µg/m^3	Continue monitoring. Implement mitigations developed at the medium action level.	Immediately report to Departmental Manager, Environmental Manager, Mine Manager and Qualified Professional. Immediately provide email notification and supporting information to the BC ENV Director[2]: envauthorizationsreporting@gov.bc.ca. Notify Indigenous Nations After inspections are complete, a log[3] of the findings will be filled out by the Departmental Manager.

Notes:
[1] The air discharge Permit 110650 states the maximum authorized rate of discharge for fugitive dust is indeterminant (BC ENV 2023).
[2] The air discharge Permit 110650 states: "4.2.5 If any medium or high triggers listed in the TRP are exceeded, the permittee must immediately provide notification to the director via email to envauthorizationsreporting@gov.bc.ca. This notification must include the following information: a) Any supporting data confirming the exceedance of the trigger, and b) A summary of the actions taken and/or planned in response to the trigger exceedance." (BC ENV 2023)
[3] The log will contain information on the location where dust plumes were visible, their approximate size and temporal persistence, activities occurring that may have caused the dust plume, meteorological conditions at the time and any actions taken. See Section 3 for more information.
[4] The most recent BC Ambient Air Quality Objectives are to be used: BC ENV 2022a. These values will be updated by the government over time.
[5] Spray bar sprinklers will be installed once trialing is complete.
[6] The influence of regional and mine site wildfire smoke will be determined by comparing contemporaneous measured concentrations of PM_{10} and $PM_{2.5}$ at the Operations Camp to Vanderhoof Court House (ENV) and Quesnel Johnson Avenue (ENV) and by examining $PM_{2.5}$ concentrations due to wildfires as modelled by firesmoke.ca.

10 Signature Page

As per PE110650 requirements the annual reports are to be prepared by a qualified professional and be submitted to ENV. This reporting also conforms to the requirements outlined in Developing a Fugitive Dust Management Plan for Industrial Projects (BC EMLI & ENV, 2023).

VP	Vice President

1.0 Purpose and Scope

The purpose of the Air Quality and Fugitive Dust Management Plan (AQDMP) is to identify measures to minimize the effects of the Project's air emissions on human health and the natural environment. The AQDMP identifies the Project's fugitive dust-emitting sources and mitigation and contingency measures aimed at effectively controlling dust emissions.

Pursuant to Part 2, Section 14 of the *Environmental Management Act*, BW Gold has received an authorization (#110650) on (May 2, 2023) for air discharges during the Construction and Operation phases of the Blackwater mine as follows:

- Discharge of fugitive dust generated at the mine site during the Construction and Operations phases; and
- Discharge of air emissions from the processing plant and assay lab during the Operations phase.

The AQDMP was developed to meet the Joint Application Information Requirements for *Mines Act/ Environmental Management Act* Permits (BC EMPR & ENV 2019). It also addresses the requirements of Environmental Assessment Certificate (EAC) #M19-01 Condition 20 and federal Decision Statement (DS) Conditions 6.1, 6.3, 6.12 and 6.15. The AQDMP also includes the information requested in Developing a Fugitive Dust Management Plan for Industrial Projects (Guidance; EMPR & ENV 2018).

Concordance tables identify where the requirements in EAC Condition 20 and DS conditions are met, and are provided in Appendix A and Appendix B respectively. A concordance table identifying where the requirements in the Guidance (EMPR & ENV 2018) are met is provided in Appendix C. The concordance tables have been developed for the purposes of compliance determination for each agency (e.g., ENV, EMLI, IAAC, and EAO) understanding where the specific authorization requirements are documented. For example, BW expects that IAAC would determine BW's compliance with NOx and SOx monitoring and not BC ENV. The AQDMP for the Transmission Line is provided in Appendix D.

1.1 Company Information

BW Gold LTD. (BW Gold) is a wholly owned subsidiary of Artemis Gold Inc., a publicly traded company listed on the TSX Venture Exchange (TSX-V: ARTG; https://www.artemisgoldinc.com). Artemis and BW Gold are incorporated in BC (#71616 9511 and #73237 6876 respectively).

The BW Gold corporate office is in Vancouver, BC:

Physical Mailing Address:	Suite 3083 – 595 Burrard Street, Vancouver BC V7L 1L3
Telephone:	(604) 558-1107
General Email:	info@artemisgoldinc.com

The Blackwater community office is in Vanderhoof, BC:

Physical Mailing Address:	139 – 1st Street, P.O. Box 440
Mailing Address:	P.O. Box 440, Vanderhoof BC V0J 3A0
Telephone:	(250) 567-3276
General Email:	office.blackwater@artemisgoldinc.com

1.2 Existing Permits

BW Gold has a permitted diesel-fired putrescible waste incinerator (*Environmental Management Act* Authorization #106530), which is located near the exploration camp. The Authorization allows a maximum discharge rate of 110 m^3/minute and maximum waste feed of 1.1 tonnes/day. Authorized waste for incineration includes putrescible camp waste, paper, cardboard and lumber scraps that cannot be recycled. Condition 2.1.3 of Authorization #106530 requires that every effort be made to minimize incineration of plastics.

BW Gold has an air discharge permit (*Environmental Management Act* Authorization #110650) that authorizes discharges from 12 sources. The Permit also requires the development of an incinerator operating plan and this AQDMP that includes a trigger plan. The Plan also details the monitoring and reporting requirements.

1.3 Exclusions

Consistent with the Guidance (EMPR & ENV 2018), the AQDMP does not address occupational health and safety requirements pertaining to workplace exposures to dust. Worker health and safety at mine sites is regulated by the Health, Safety and Reclamation Code for Mines in British Columbia (EMLI 2022). The Project's Occupational Health and Safety Program is provided under a separate cover.

Offsite infrastructure such as the FSR and Transmission Line are also excluded from the AQDMP.

1.4 Related Documents

Environmental Assessment Certificate M#19-01 Condition 20 requires the AQDMP to indicate how this plan informs the Country Foods Monitoring Plan (CFMP) and the Wildlife Mitigation and Monitoring Plan (WMMP).

The CFMP and WMMP will be evaluated for updates and revisions if corrective actions to reduce contaminant concentrations to avoid adverse health effects to receptors are implemented, based on exceedances of contaminants of potential concern (COPC) and corresponding concentrations (triggers) based on monitoring data from implementing the AQDMP, when compared to BC objectives (Entia 2021).

Fugitive dust deposition monitoring is not recommended by the Ministry of Environment and Climate Change Strategy (ENV) for the purposes of wildlife and human health protection (ENV 2020) and is not included in the AQDMP. However, as required by EAC Condition 41, analysis of dust for metal concentrations will be included in the CFMP and data collected under the CFMP can be used to inform the WMMP.

Monitoring of trace element (metals) uptake in vegetation and soils is considered in the Reclamation and Closure Plan and the CFMP. Plant tissue can be affected by the deposition of dust (particulate matter) containing metals generated by Project activities. Plants can also accumulate metals from the soil through uptake of metals through the root. Monitoring under the CFMP will determine whether concentrations of metals have changed in soil or in vegetation tissue because of Project activities. The results of trace metals monitoring and potential implications for wildlife based on results from monitoring under the CFMP will be addressed in the WMMP.

Results of the AQDMP for monitoring of particulate matter (Section 8.3.3) will inform the CFMP, as this monitoring is required by EAC Condition 41 for the CFMP.

2.0 Project Overview

The Blackwater Gold Project (the Project) is a gold and silver open pit mine located in central British Columbia (BC), approximately 112 kilometres (km) southwest of Vanderhoof, 160 km southwest of Prince George, and 446 km northeast of Vancouver.

The Project is presently accessed via the Kluskus Forest Service Road (FSR), the Kluskus-Ootsa FSR and a new mine access road which connects to the Kluskus-Ootsa FSR at km 142. The Kluskus FSR joins Highway 16 approximately 10 km west of Vanderhoof. The new, approximately 13.8 km road (Mine Access Road) was built to replace the existing exploration access road, which will be decommissioned. The new mine access road is at km 124.5. Driving time from Vanderhoof to the mine site is about 2.5 hours.

Major mine components include a tailings storage facility (TSF), ore processing facilities, waste rock, overburden and soil stockpiles, borrow areas and quarries, water management infrastructure, water treatment plants, accommodation camps and ancillary facilities. The gold and silver will be recovered into a gold-silver doré product and shipped by air and/or transported by road. Electrical power will be supplied by a new approximately 135 km, 230 kilovolt overland transmission line that will connect to the BC Hydro grid at the Glenannan substation located near the Endako mine, 65 km west of Vanderhoof.

The Blackwater mine site is located within the traditional territories of Lhoosk'uz Dené Nation (LDN), Ulkatcho First Nation (UFN), Skin Tyee Nation, and Tsilhqot'in Nation. The Kluskus and Kluskus-Ootsa FSRs and Project transmission line cross the traditional territories of Nadleh Whut'en First Nation (NWFN), Saik'uz First Nation (SFN), and Stellat'en First Nation (StFN; collectively, the Carrier Sekani First Nations) as well as the traditional territories of the Nazko First Nation (NFN), Nee Tahi Buhn Band, Cheslatta Carrier Nation, and Yekooche First Nation (BC EAO 2019a, 2019b).

Project construction is anticipated to take two years. Mine development will be phased with an initial milling capacity of 15,000 tonnes per day (t/d) for the first five years of operation. After the first five years, the milling capacity will increase to 33,000 t/d for the next five-years, and to 55,000 t/d in Year +11 until the end of the 23-year mine life. The Closure phase is Year +24 to approximately Year +36 and is defined by the duration required to fill the Open Pit to the target closure level and the TSF is allowed to passively discharge to Davidson Creek via a closure spillway. The Closure phase is shorter than that what was presented in the *Joint Mines Act* / *Environmental Management Act* Permits Application (March 2022) as a result of optimizations to the Project. The Post-closure is now estimated to begin in Year +37.

New Gold Inc. received Environmental Assessment Certificate #M19-01 (EAC) on June 21, 2019 under the 2002 *Environmental Assessment Act* (BC EAO 219c) and a Decision Statement (DS) on April 15, 2019 under the Canadian *Environmental Assessment Act*, 2012 (CEA Agency 2019). In August 2020, Artemis Gold Inc. (Artemis) acquired the mineral tenures, assets, and rights in the Blackwater Project that were previously held by New Gold Inc. On August 7, 2020, the Certificate was transferred to BW Gold LTD. (BW Gold), a wholly owned subsidiary of Artemis, under the 2018 *Environmental Assessment Act*. The Impact Assessment Agency of Canada notified BW Gold on September 25, 2020 to verify that written notice had been provided within 30 days of the change of proponent as required in Condition 2.16 of the DS, and that a process had been initiated to amend the DS.

BW Gold received *Mines Act* Permit M-246 on June 22, 2021, and *Environmental Management Act* Permit PE-110602 on June 24, 2021, authorizing early construction works for the Project. These works include clearing, grubbing ditching, and site levelling at the Plant Site location and sediment and erosion controls, including construction of ditches, diversions, and a sediment control pond (SCP). BW Gold received *Environmental Management Act* Permit PE-110652 on May 2, 2023, authorizing discharge of effluent to surface water and groundwater from the Blackwater mine. BW Gold received *Environmental Management Act* Permit PE-110650 on May 2, 2023 authorizing the discharge of air contaminants to the atmosphere from the Blackwater Mine.

3.0 Roles and Responsibilities

BW Gold has the obligation of ensuring that all commitments are met and that all relevant obligations are made known to mine personnel and site contractors during all phases of the mine life. A clear understanding of the roles, responsibilities, and level of authority that employees and contractors have when working at the mine site is essential to meet Environmental Management System (EMS) objectives.

Table 3-1 provides an overview of general environmental management responsibilities during all phases of the mine life for key positions that will be involved in environmental management. Other positions not specifically listed in Table 3-1 but that will provide supporting roles include independent environmental monitors, an Engineer of Record for tailings storage facilities and dams as required, an Independent Tailings Review Board, TSF qualified person, geochemistry Qualified Registered Professional (QRP), and other qualified persons and QRPs as required.

Table 3-1: Blackwater Gold Roles and Responsibilities

Position	Responsibility
Chief Executive Officer (CEO)	The CEO is responsible for overall Project governance. Reports to the Board.
Chief Operating Officer (COO)	The COO is responsible for engineering and Project development and coordinates with the Mine Manager to ensure overall Project objectives are being managed. Reports to the CEO.
Vice President (VP) Environment & Social Responsibility	The VP is responsible for championing the Environmental Policy Statement and EMS, establishing environmental performance targets and overseeing permitting. Reports to the COO.
General Manager (GM) Development	The GM Development is responsible for managing project permitting, the Project's administration services and external entities, and delivering systems and programs that ensure Artemis's values are embraced and supported: Putting People First, Outstanding Corporate Citizenship, High Performance Culture, Rigorous Project Management and Financial Discipline. Reports to the COO.
Mine Manager	The Mine Manager, as defined in the *Mines Act*, has overall responsibility for mine operations, including the health and safety of workers and the public, EMS implementation, overall environmental performance and protection, and permit compliance. The Mine Manager may delegate some of their responsibilities to other qualified personnel. Reports to the GM.
Construction Manager (CM)	The CM is accountable for ensuring environmental and regulatory commitments/ and obligations are being met during the construction phase. Reports to the GM.
Environmental Manager (EM)	The EM is responsible for the day-to-day management of the Project's environmental programs and compliance with environmental permits, updating EMS and Management Plans. The EM or designate will be responsible for reporting non-compliance to the CM, and Engineering, Procurement and Construction Management (EPCM) contractor, other contractors, the Company and regulatory agencies, where required. The EM informs the Environmental Monitors of current site conditions that may influence monitoring programs. Supports the CM and reports to the Mine Manager.

Position	Responsibility
Departmental Managers	Departmental Managers are responsible for implementation of the EMS relevant to their areas. Report to the Mine Manager.
Indigenous Relations Manager	Indigenous Relations Manager is responsible for Indigenous engagement throughout the life of mine. Also responsible for day-to-day management and communications with Indigenous groups. Reports to the VP Environment & Social Responsibility.
Community Relations Advisor	Community Relations Advisor is responsible for managing the Community Liaison Committee and Community Feedback Mechanism. Reports to the Indigenous Relations Manager.
Aboriginal Monitors	Aboriginal Monitors are required under EAC #M19-01 Condition 17 and will be responsible for monitoring for potential effects from the Project on the Indigenous interests. Aboriginal Monitors will be involved in the environmental monitoring, adaptive management and follow-up monitoring programs. Report to the EM.
Employees and Contractors	Employees and contractors are responsible for being aware of permit requirements specific to their roles and responsibilities. Report to Departmental Managers.
Qualified Registered Professionals or Qualified Persons	Qualified registered professionals and qualified persons will be retained to review objectives and conduct various aspects of environmental and social monitoring as specified in Environmental and Social Management Plans.

BW Gold will employ a qualified person as an EM who will ensure that the EMS requirements are established, implemented and maintained, and that environmental performance is reported to management for review and action. The EM is responsible for retaining the services of qualified persons or QRPs with specific scientific or engineering expertise to provide direction and management advice in their areas of specialization. The EM will be supported by a team of Environmental Monitors that will include Environmental Coordinators and Technicians and by a consulting team of subject matter experts in the fields of environmental science and engineering.

During the Construction phase, BW Gold will be entering into multiple Engineering, Procurement and Construction contracts, likely for the Transmission Line, Process Plant, Tailings and Reclaim System, and 25 kV Power Distribution. Each engineer/contractor will have their own CM and there will be a BW Gold responsible project manager and/or Superintendent who ultimately reports to the GM Development. Some of the scope, such as the TSF and Water Management Structures will be self-performed by BW Gold, likely using hired equipment. Other smaller scope packages may be in the form of Engineering, Procurement and Construction Management (EPCM) contracts. The EPCM contractors will report to the CMs who will ultimately be responsible for ensuring that impacts are minimized, and environmental obligations are met during the Construction phase. For non-EPCM contractors, who will perform some of the works on site, the same reporting structure, requirements, and responsibilities will be established as outlined above. BW Gold will maintain overall responsibility for management of the construction and operation of the mine site and will therefore be responsible for establishing employment and contract agreements, communicating environmental requirements, and conducting periodic reviews of performance against stated requirements.

The CM is accountable for ensuring that environmental and regulatory commitments/obligations are being met during the construction phase. The EM will be responsible for ensuring that construction activities are proceeding in accordance with the objectives of the EMS and associated management plans. The EM or designate will be responsible for reporting non-compliance to the CM and EPCM contractor, other contractors, and regulatory agencies, where required. The EM or designate will have the authority to stop

any construction activity that is deemed to pose a risk to the environment; work will only proceed when the identified risk and concern have been addressed and rectified.

Environmental management during operation of the Project will be integrated under the direction of the EM, who will liaise closely with Departmental Managers and will report directly to the Mine Manager. The EM will be supported by the VP of Environment and Social adhere adherence to corporate environmental standards. The EM will be accountable for implementing the approved management plans and reviewing them periodically for effectiveness. Departmental area managers (e.g., mining, milling, and plant/site services) will be directly responsible for implementation of the EMS, management plans, and standard operating procedures relevant to their areas. All employees and contractors are responsible for daily implementation of the practices and policies contained in the EMS.

During closure and post-closure staffing levels will be reduced to align with the level of activity associated with these phases. Prior to initiating closure activities, BW Gold will revisit environmental and health and safety roles and responsibilities to determine resources needed to meet permit monitoring and reporting requirements. The Mine Manager will maintain overall responsibility for management of Closure and Post-closure activities.

Pursuant to Condition 19 of the EAC #M19-01, Conditions A(10)(a-c) of the M-246 *Mines Act* Permit, Condition 3.7 of *Environmental Management Act* Permit #110652, BW Gold has established an Environmental Life of Mine Committee (ELoMC) to facilitate information sharing and provide advice on the development and operation of the Project, and the implementation of ELoMC conditions, in a coordinated and collaborative manner. Committee members include representatives of the BC EAO, UFN, LDN, NWFN, StFN, SFN, NFN, BC EMLI, BC ENV, and BC MOF/WLRS.

Pursuant to Condition 17 of the EAC #M19-01, Aboriginal Group Monitor and Monitoring Plan, BW Gold will retain or provide funding to retain a monitor for each Indigenous nations defined in the EAC #M19-01 prior to commencing construction and through all phases of the mine life. The general scope of the monitor's activities will be related to monitoring for potential effects from the Project on Indigenous nations' interests.

Pursuant to Part A. General, Section 10 of the *Mines Act* Permit M-246, BW Gold will establish a "Life of Mine Committee" by May 31, 2023. BW Gold will offer membership annually in the Life of Mine Committee to the Indigenous Communities referred to Condition A.8 and to Provincial Agencies, including but not limited to the Ministry of Energy, Mines and Low Carbon Innovation, Ministry of Environment and Climate Change Strategy, and the Ministry of Forests. Condition 10(b) states that the Permittee must ensure that the Life of Mine Committee scope of work includes: (i) review of existing and proposed environmental management activities; (ii) review of existing and proposed environmental monitoring activities; (iii) review of implemented and proposed reclamation and closure activities, in addition to other conditions.

4.0 Adaptive Management Framework

The AQDMP is a living document that will evolve over time in response to monitoring results and regulatory changes. The AQDMP incorporates adaptive management as follows:

- **Plan**
  - Identify and characterize fugitive dust sources;
  - Identify composition and size distribution of particulate emissions;
  - Identify contributing factors to dust generation;
  - Identify areas with potential air quality and dustfall impacts;
  - Describe fugitive dust control for each source; and
  - Prepare schedule for implementation and operation of control measures.
- **Do**
  - Implement mitigation measures;
  - Identify maintenance and record keeping procedures for control and monitoring equipment; and
  - Develop training procedures.
- **Monitor**
  - Conduct inspections and maintenance; and
  - Complete and maintain monitoring records.
- **Adjust**
  - Follow up on the evaluation of monitoring results;
  - Review of the monitoring program in terms of effectiveness in detecting effects;
  - Recommendations provided by a qualified professional for changes to the monitoring plan, objectives, frequency, methods, or timing;
  - Engagement tracking to record input from Indigenous groups and regulators such as the EAO, ENV and Canada Impact Assessment Agency; and
  - Revise the AQDMP as new and/or altered measures are introduced.

5.0 Facility Description and Setting

5.1 Physical Location and Access

The Project is an open pit gold and silver mine located approximately 112 kilometres (km) southwest of Vanderhoof and 160 km southwest of Prince George, BC. The Project falls within NTS map sheet 93F/02, centred at 5893000 N and 375400 E (UTM Zone 10 NAD83). The mine site is centred at 53°11'22.872" N and 124°52'0.437" W. The Project is accessed via the Kluskus Forest Service Road (FSR), the Kluskus-Ootsa FSR and a mine access road, which will connect to the Kluskus-Ootsa FSR at km 124.5.

Figure 5.1-1 and Figure 5.1-2 identifies the Project location and the access route from Vanderhoof in relation to nearby communities. The mine site is located within the traditional territories of LDN and UFN and downstream of the traditional territories of NWFN, SFN, and StFN (collectively, the Carrier Sekani First Nations).

BW Gold holds a 100% recorded interest in 328 mineral claims covering an area of 148,688 hectares (ha) distributed among the Blackwater, Capoose, Auro, Key, Parlane, and RJK claim blocks (Artemis 2020). The Blackwater mine site is located within the Blackwater claim block. Figure 5.1-2 identifies the mineral tenures within the proposed *Mines Act* permit boundary.

5.2 Environmental Setting

The Project is located on the Nechako Plateau, a region of flat to gently rolling terrain on the northern slope of Mount Davidson. The Project maintains two meteorological stations referred to as the Blackwater Low, and Blackwater High (discussed in Section 8.3.1). The mean annual wind speed at the Blackwater low elevation (1,050 masl) meteorological station (Blackwater Low) is approximately 2.2 m/s (7.9 km/h), with the wind direction being predominantly from the west and southwest. Strong southeast winds were also evident in the fall and winter at the Blackwater Low station (Figure 5.2-1). At the Blackwater high elevation (1,470 masl) station (Blackwater High) the wind direction is predominately from the west with strong southwest gusts during the fall and winter (Figure 5.2-2). The mean annual wind speed at the Blackwater High station is approximately 3.0 m/s (10.8 km/h). Meteorological baseline reports are provided in KP (2021a,b).

5.3 Facility and Process Description

The Project includes an open pit, Plant Site and processing plant, waste and topsoil stockpiles, borrow areas and TSF. The general arrangement of the proposed mine site at Year +23 (full mine buildout) is shown in Figure 5.3-1. Section 6 (Table 6-1) provides a list of site activities that could result in the generation of fugitive dust.

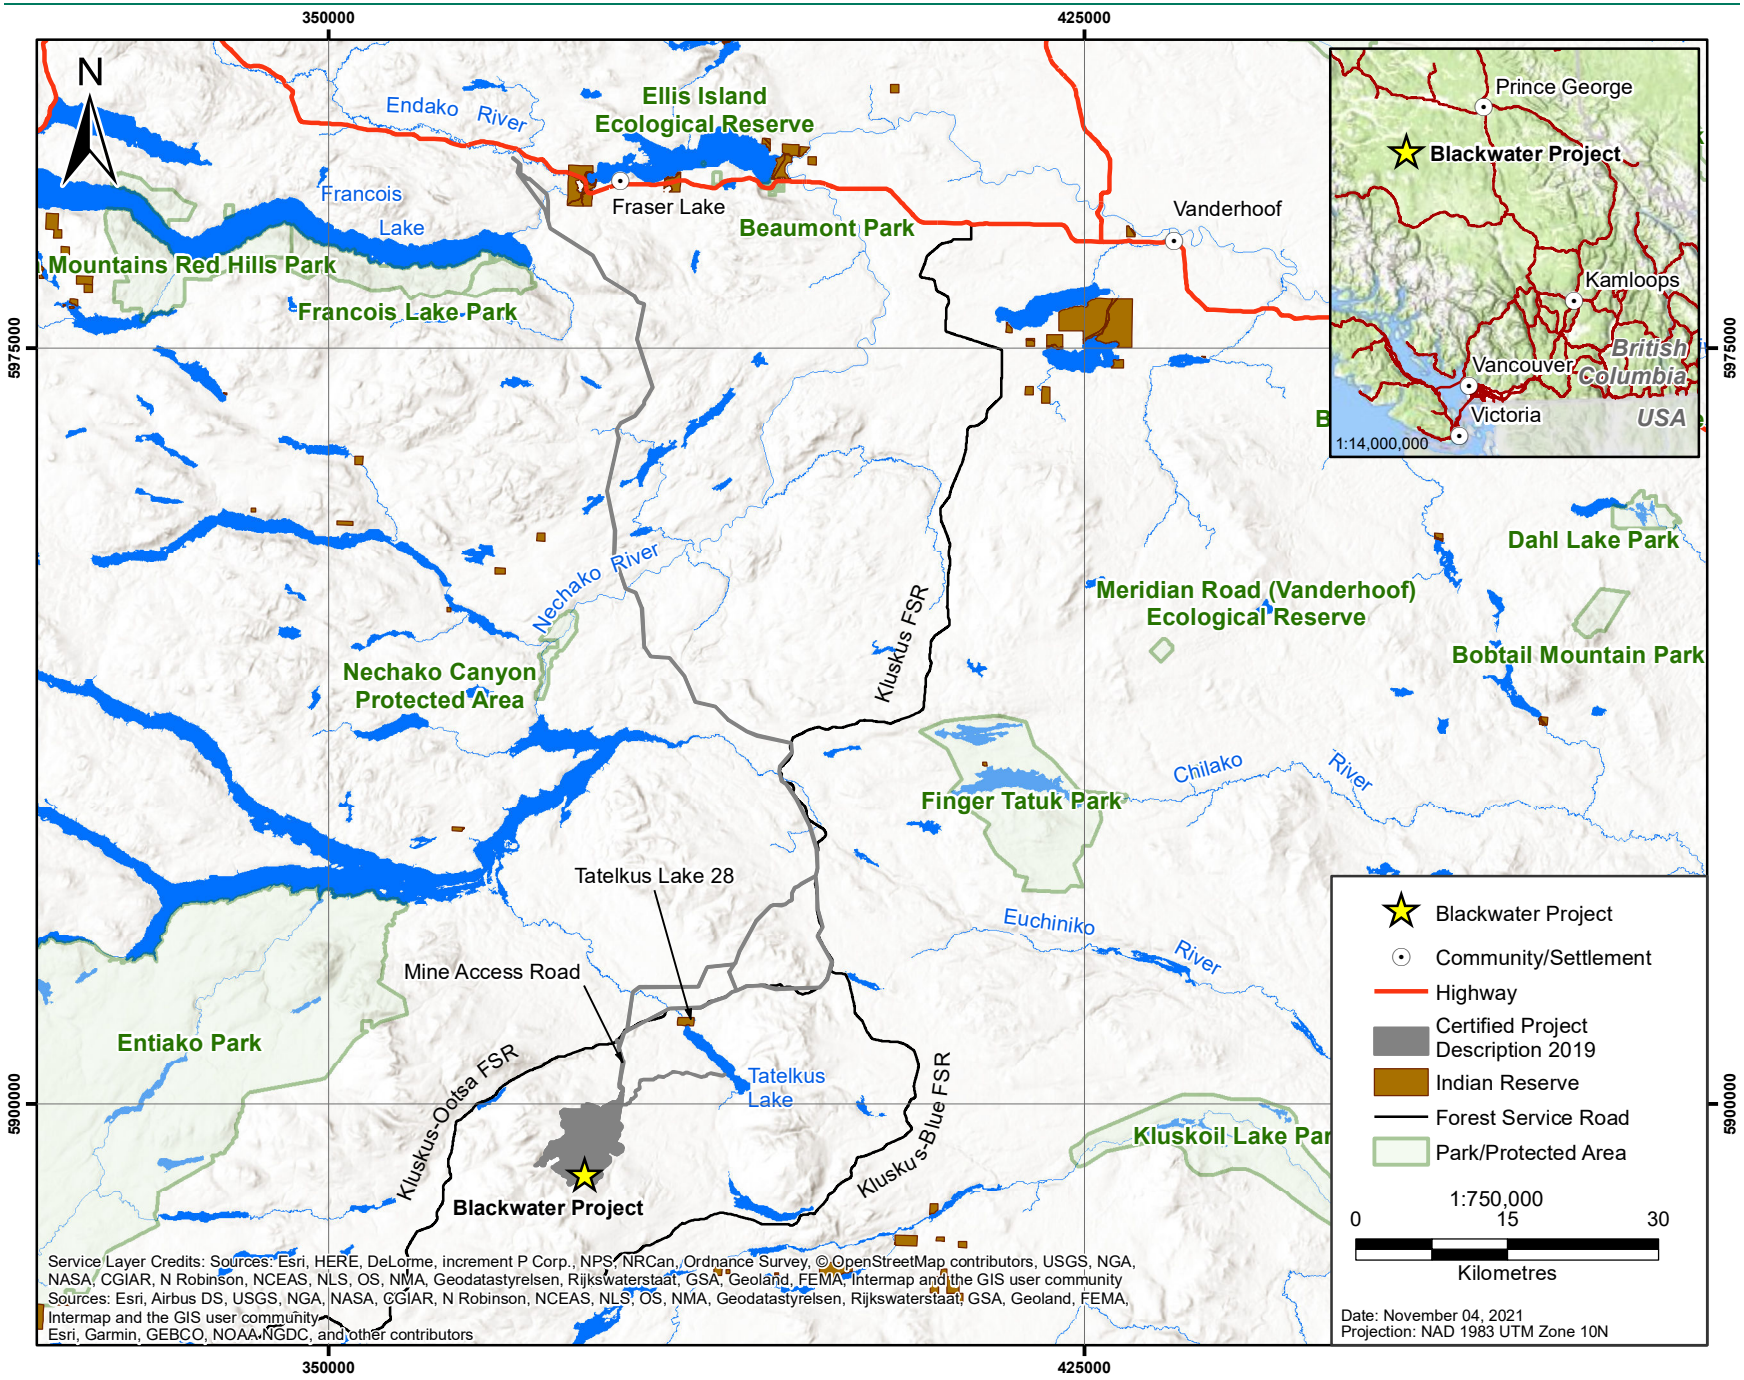

Figure 5.1-1: Blackwater Project Location

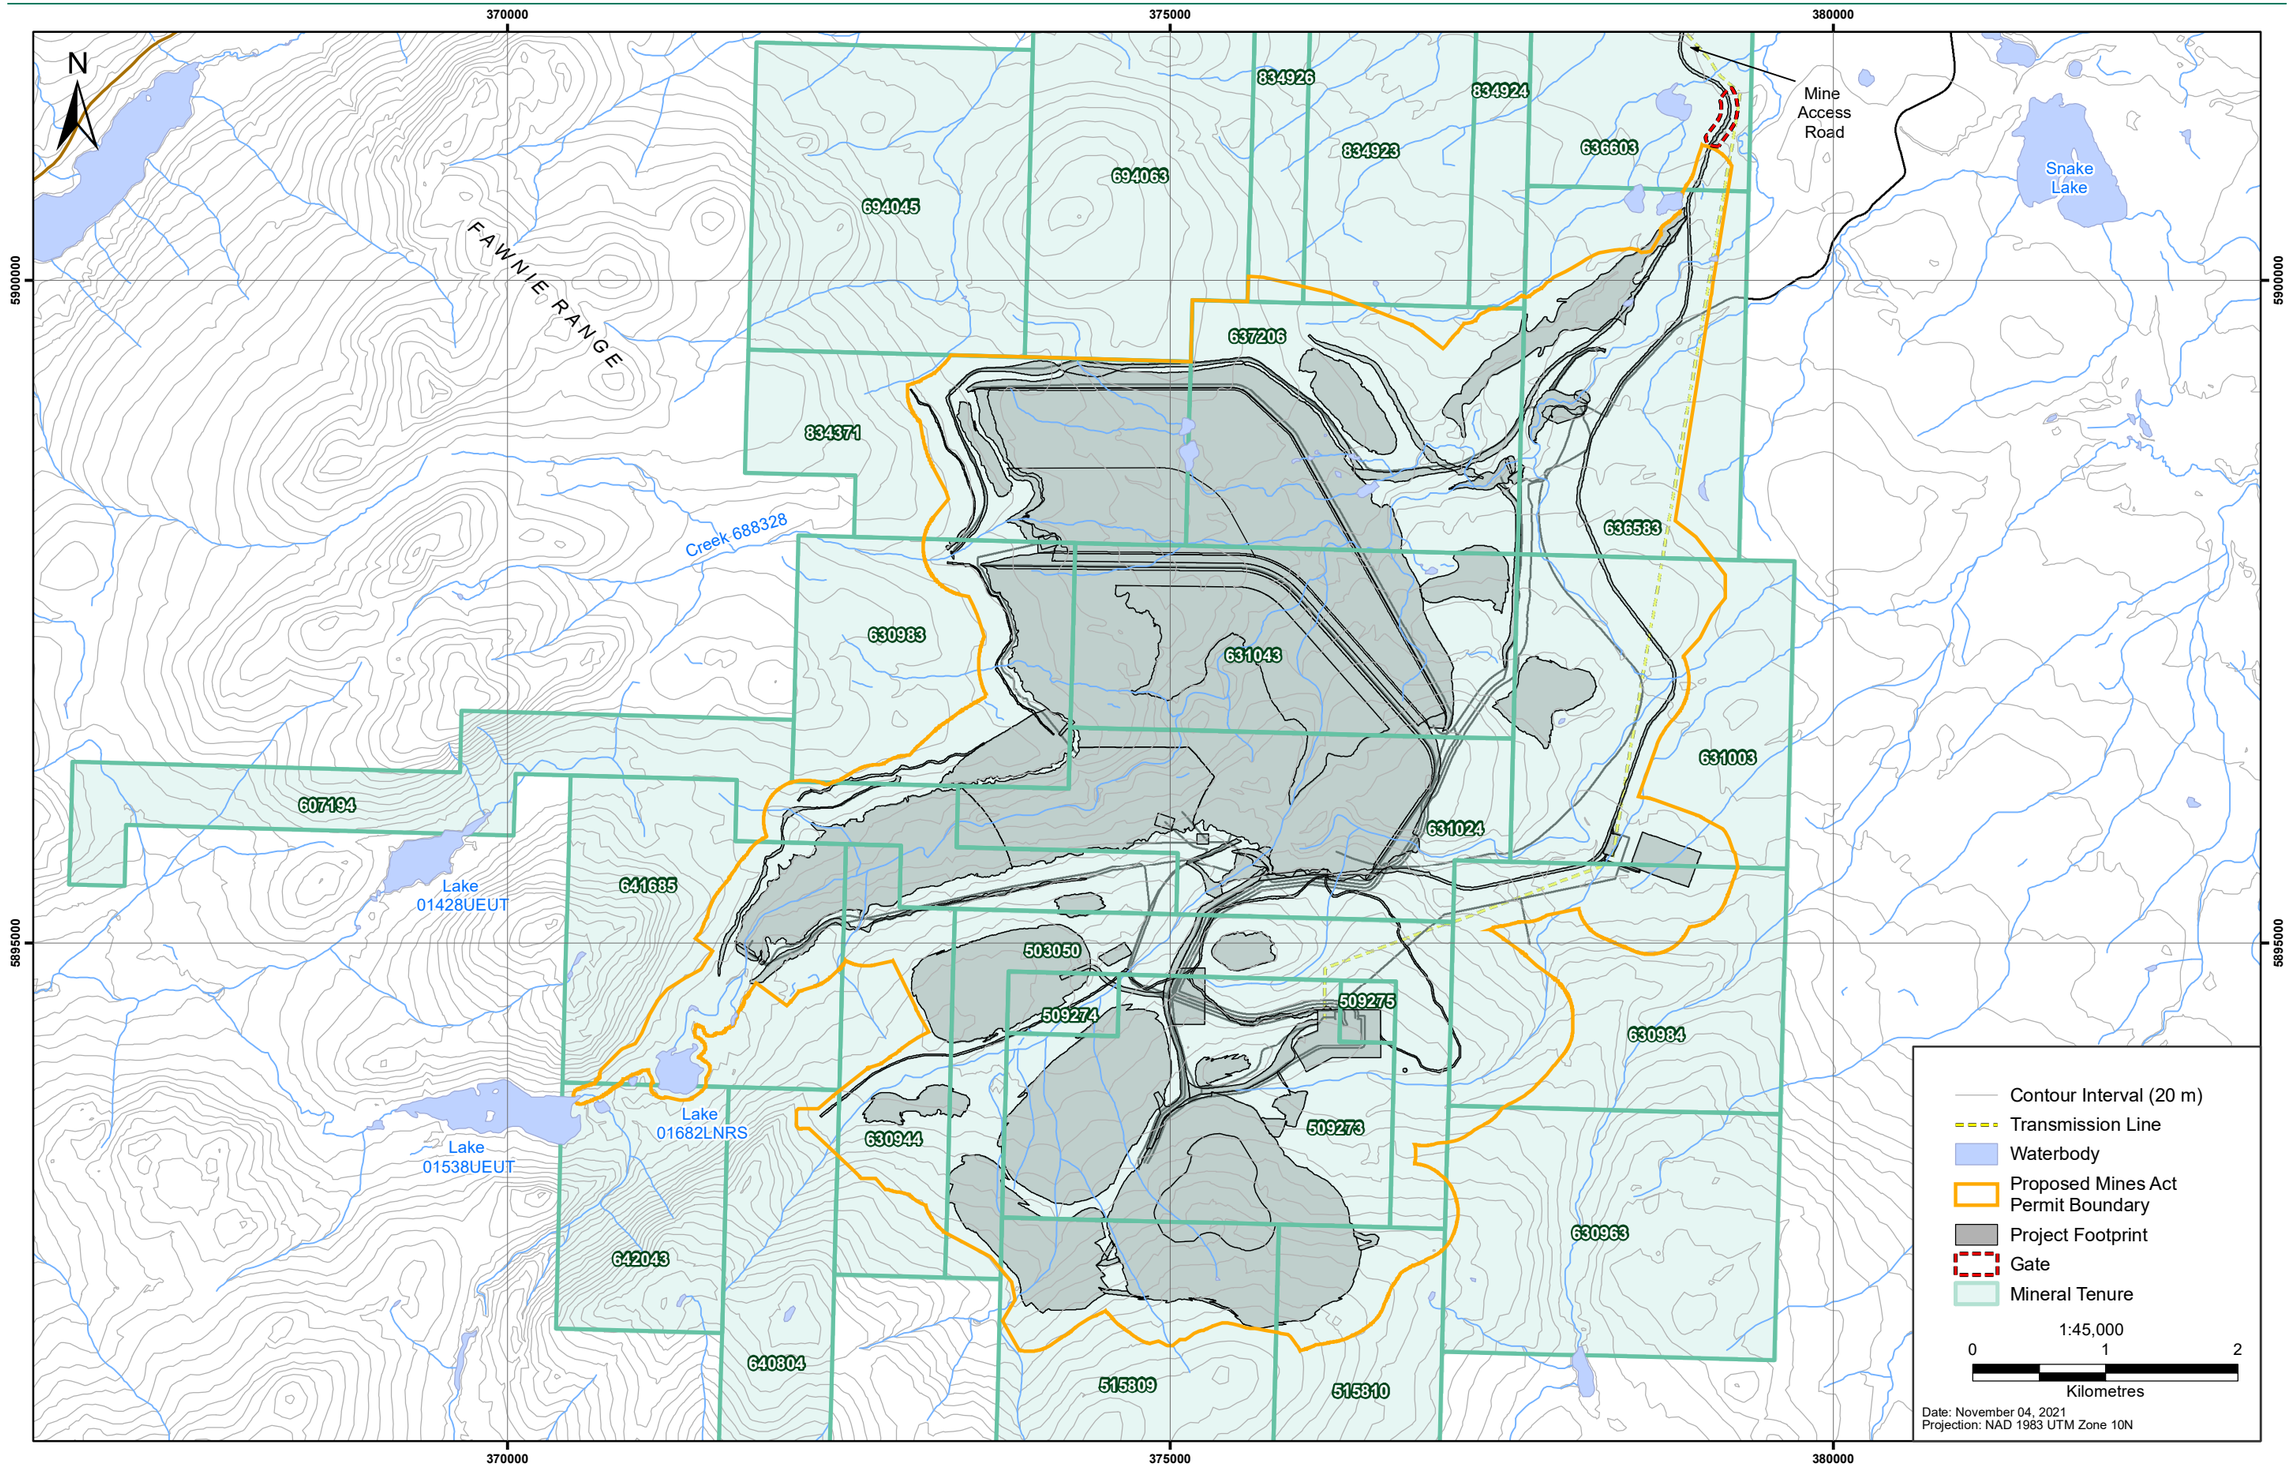

Figure 5.1-2: Blackwater Mineral Tenures within Proposed Mines Act Permit Boundary

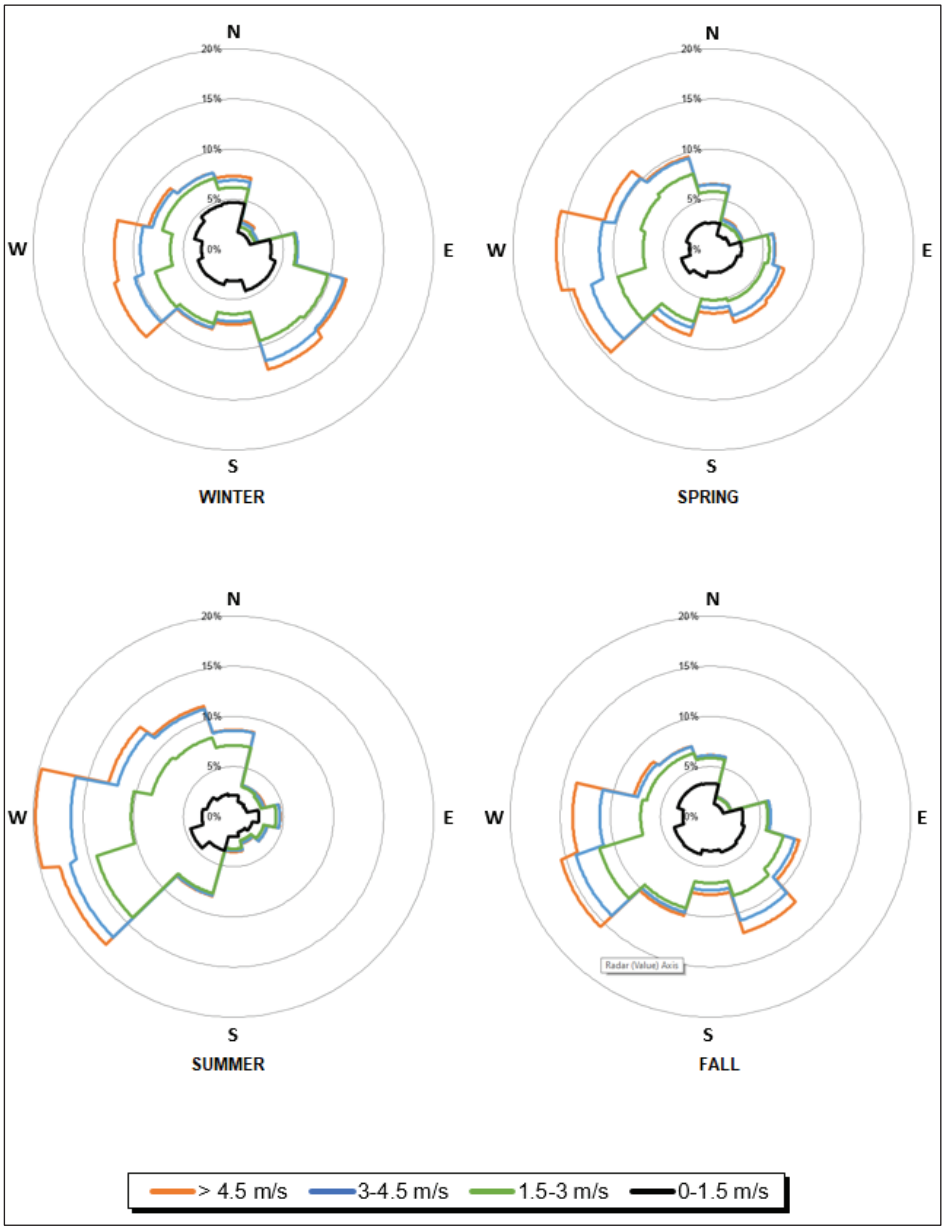

NOTES:
1. WINTER CONSISTS OF DECEMBER TO FEBRUARY, SPRING CONSISTS OF MARCH TO MAY, SUMMER CONSISTS OF JUNE TO AUGUST, AND FALL CONSISTS OF SEPTEMBER TO NOVEMBER.
2. THE PREVAILING WIND DIRECTION IS THE ONE WITH THE LONGEST SPOKE (HIGHEST PERCENTAGE).

Figure 5.2-1: Blackwater Low Station Wind Roses

Figure 5.2-2: Blackwater High Station Wind Roses

Source: Knight Piésold Consulting (2021).

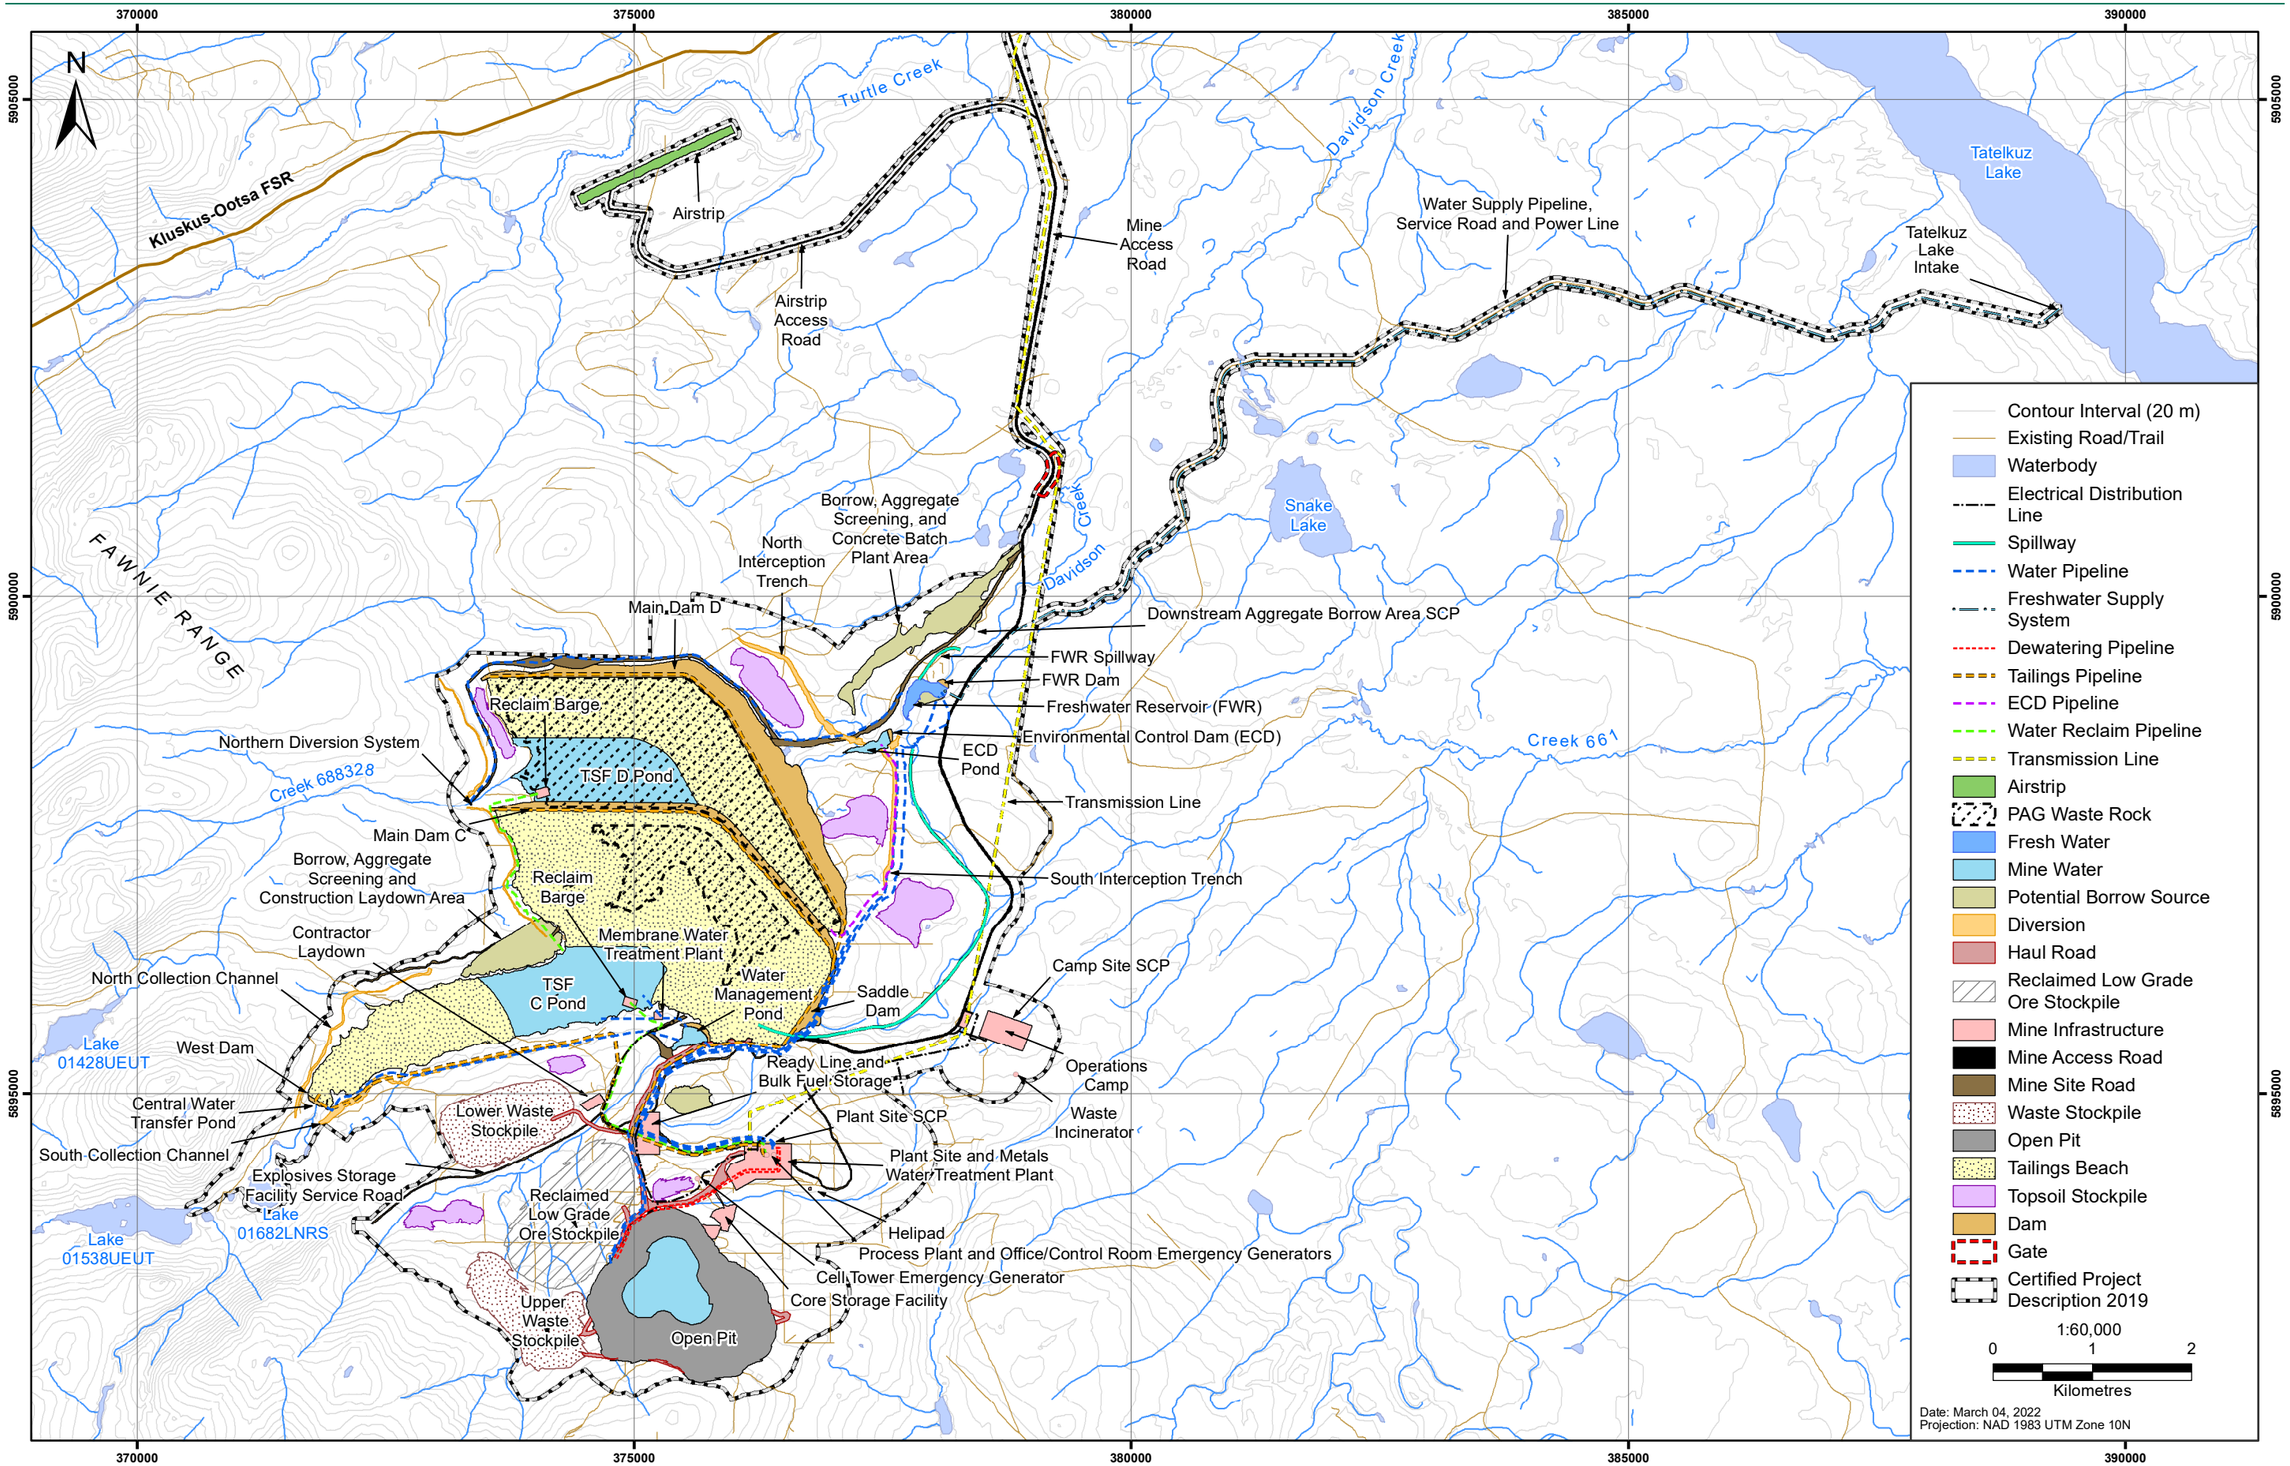

Figure 5.3-1: Mine Site General Arrangement (Year +23)

5.3.1 Open Pit

Ore will be extracted using drilling and blasting from the Open Pit located in the southern portion of the proposed mine site. At its greatest extent, the Open Pit will be 228 ha, approximately 2.0 km long on the east to west axis and 1.8 km long on the north to south axis. When fully developed, the anticipated depth of the pit will range between 350 m to 550 m below the surrounding ground surface (masl). The initial production ramp up (Year +1 to Year +5) will be undertaken using 400 t class hydraulic shovels and 190 t payload class haul trucks. As production increases, the load and haul fleet will be expanded with 550 t class hydraulic shovels and 220 t payload class haul trucks. The initial drill and loading fleets are planned to be diesel drive, with expansion of the fleet to include electric drills and shovels after Year +5.

5.3.2 Processing Plant

The processing plant, located north of the Open Pit, will utilize a carbon in leach gold recovery process, with gold doré produced on-site. The plant will operate on a 5,500 kt per annum throughput from Year +1 to Year +5, 12,000 kt per annum throughput from Year +6 to Year +10, and a 20,000 kt per annum throughput from Year +11 to Year +23, the end of operations. The general arrangement for the processing plant at Year +1 is shown in Figure 5.3-2. An ore process flow diagram is presented in Figure 5.3-3.

BW Gold has integrated engineering controls to mitigate fugitive dust emissions from the processing plant, which includes active dust collection, wet grinding, enclosures, and stack emissions (Ausenco 2021). These controls are outlined below.

Active Dust Collection

Active dust collection systems will be installed in the following areas:

- Primary crusher – baghouse collector including blower and ducting with pickups at jaw crusher feeder and vibrating grizzly discharge;
- Secondary and tertiary crusher – baghouse collector including fan and ducting with pickups at screen feed and discharge chutes and cone crusher feeder head;
- Reclaim tunnel – cartridge style collector including fan and ducting with pickups at each reclaim feeder discharge;
- Fire Assay Main Lab – cartridge style dust collector – dust collection system services the electric cupellation and diesel-fired fusion furnace;
- Fire Assay Lab Sample Preparation – cartridge style sample preparation dust collector; and
- Lime Silo – cartridge style dust collector baghouse exhaust will contain lime dust and ambient air.

Wet Grinding

Wet grinding will be utilized for the grinding circuit. This medium is more energy efficient than dry grinding and eliminates dust associated with the ore grinding process.

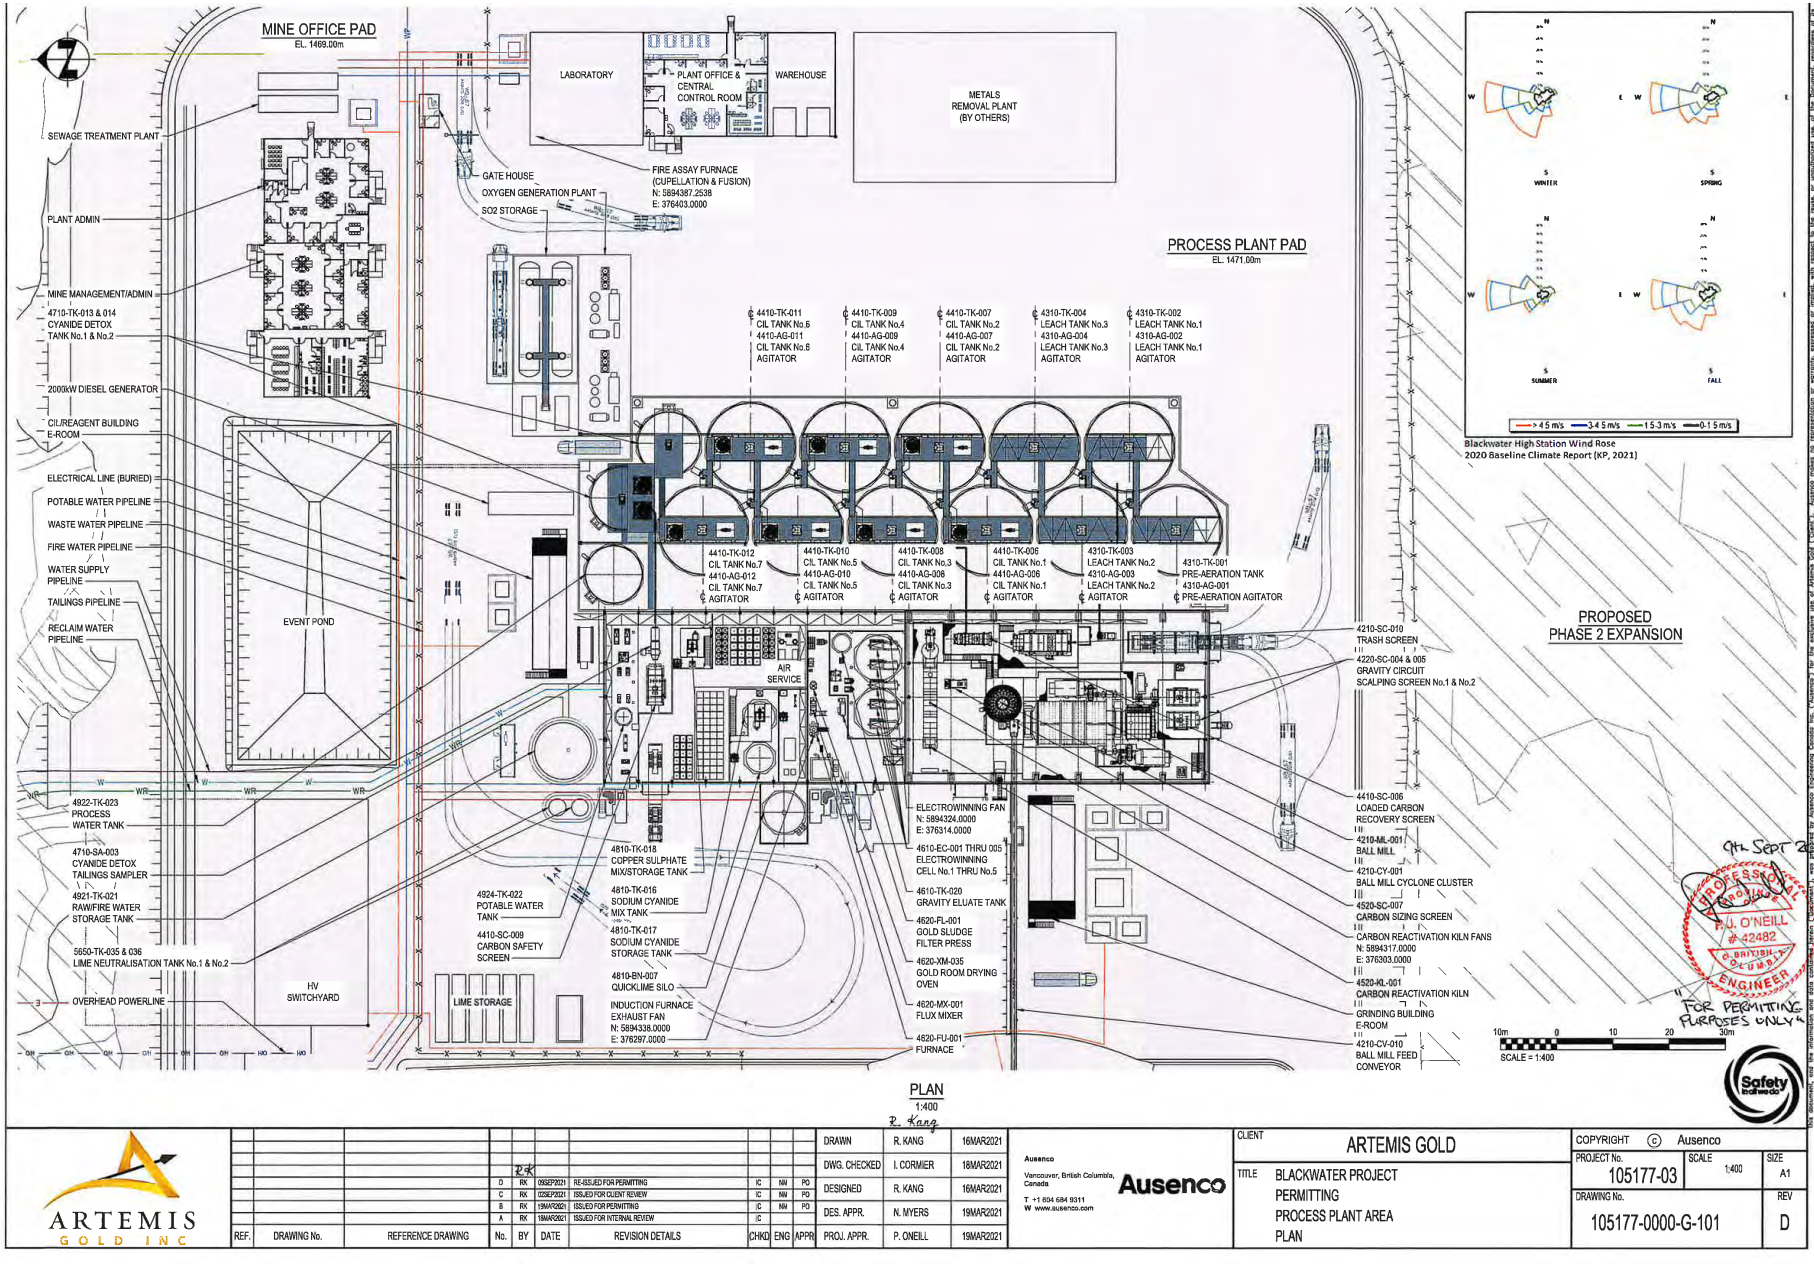

Figure 5.3-2: Blackwater Process Plant Area Site Plan

Source: Ausenco (2021; Appendix 3-F)

Figure 5.3-3: Ore Process Flow Diagram

Source: Ausenco (2021).

Enclosures

Most handing and processing equipment at the Plant Site will be contained in enclosures to limit fugitive dust emissions. These enclosures and associated heating, ventilation and air conditioning (HVAC) considerations include:

- Primary crusher (parts of the building will be enclosed, cladded, insulated and heated);
- Secondary and tertiary crusher (building will be enclosed, cladded, insulated, and heated);
- Reclaim tunnel (will be enclosed, without insulation or heating [HVAC – ventilation only]); and
- Mill building/ wet process plant (will be enclosed, cladded and insulated [HVAC – heated to 10 ºC minimum and ventilated]).

5.3.3 Tailings Storage Facility

The TSF comprises two adjacent sites, TSF Site C and TSF Site D and four embankments (Site C Main Dam, Site D Main Dam, Site C Saddle Dam, and Site C West Main Dam). The TSF is designed to permanently store tailings and potentially acid generating waste rock, provide water for processing, and support mine site water balance management. During operations, tailings will be delivered by gravity via a pipeline from the processing plant to either TSF Site C or TSF Site D.

Tailings beaches will be developed and maintained if and as required at the direction of the EoR throughout the life of mine for each dam. Tailings beaches prevent direct contact of the pond supernatant with dam embankments and limits the infiltration of seepage into the embankment. The particle size distribution of the tailings samples were approximately 44% fine sand, 46% silt, and 10% clay. The tailings are fairly coarse with good packing density and low rheology.

5.3.4 Stockpiles

Upper and Lower Waste Stockpiles

Two stockpiles will store NAG overburden (OVB) and NAG waste rock from stripping and open pit mining. The Upper Waste Stockpile will be located west of the Open Pit and has a planned maximum capacity of 31 Mt. The Lower Waste Stockpile will be located between the TSF and explosives storage road and has a planned maximum capacity of 29 Mt.

Low Grade Ore Stockpile

The Low Grade Ore (LGO) Stockpile will store ore prior to processing. The stockpile will be located northwest of the open pit with a planned maximum capacity of approximately 111 Mt. The LGO will be completely processed by Y +23.

Topsoil Stockpiles

During the mine life, reclamation materials (i.e., topsoil with subsoil, organic soil, woody debris) will be salvaged and stored for use in progressive or final reclamation. The total estimated volume of potentially salvageable soil is 8.46 Mm^3. There will be seven soil stockpiles on the proposed mine site. Final stockpiles will be seeded as surfaces are graded to final repose angles and become available for seeding with non-propagating grass species, native grasses and forbs, and tree and shrub species to reduce erosion and invasive-species establishment and to control fugitive dust dispersal.

5.3.5 Borrow and Aggregate Crushing and Screening Areas

Eight borrow areas will be developed in Year -2 in order to produce aggregate to construct mine infrastructure and include:

- Mine site borrow areas;
- Borrow, aggregate screening, and construction laydown areas;
- TSF C additional borrow area;
- TSF C North borrow area;
- TSF C South borrow area;
- TSF D borrow areas;
- Freshwater Reservoir borrow area; and
- Borrow, aggregate screening and concrete plant areas.

Crushing and screening plants will produce concrete aggregates, structural fills, road general fills, sub base and base coarse fills.

5.3.6 Concrete Batch Plants

Concrete batch plants will be mobilized in Year -2. A high volume plant will operate during construction with additional plants available during peak pouring periods and as a backup to the high volume plant. All dry mix concrete batch plants will be winterized.

5.3.7 Refuse Incinerator

A putrescible refuse incinerator is located on site. The incinerator will be utilized during all Project phases. The incinerator is authorized to burn a maximum of 1.1 tonnes/day of the following:

- Putrescible camp waste;
- Paper;
- Cardboard, and
- Lumber scraps that cannot be recycled.

BW Gold plans to use the incinerator as permitted. Incinerator ash is disposed of in accordance with existing approval for the facility, *Environmental Management Act* Permit #106530. Ash is deposited in an off-site landfill. When operational conditions require that a landfill is brought online, a landfill will be located, permitted and constructed. Any excess waste above and beyond what the permitted incinerator can process will be disposed of in an alternate manner, for example taken off-site for disposal. As the site develops and head count increases, consideration will be given to expanding site incineration capacity if the waste generated exceeds the permitted capacity of the existing incinerator.

6.0 Identification of Potential Air Emission Sources

Fugitive dust is the primary source of air emissions. Potential dust sources include material handling/ re-handling, construction and use of unpaved roads, blasting, compaction, drilling, grading, material (including ore) loading and unloading, and ore processing. Erodible surface areas such as stockpiles and the TSF beach) are also sources of fugitive dust.

Table 6-1 provides an overview of the Project activities anticipated to emit fugitive dust by Project phase. Table 6-2 provides further detail on dust emissions by Project component, further illustrated by Figure 6-1. Table 6-3 identifies emission sources and predicted emissions of total suspended particulate (TSP), particulate matter less than 10 µm (microns) in diameter (PM_{10}), particulate matter less than 2.5 µm in diameter ($PM_{2.5}$), carbon monoxide (CO), nitrogen oxides (NOx); and sulphur dioxide (SO_2).

Non-dust air emission sources include, but may not be limited to, mine fleet exhaust (multiple), backup diesel generators (x6), NOx and SO_2 from blasting and the existing diesel-fired putrescible waste incinerator.

Table 6-1: Activities Resulting in Fugitive Dust by Project Phase

Construction	Operations	Closure	Post-closure
• Land clearing and earthworks for all on-site and off-site Project components • Construction and use of unpaved access and mine site roads • Surface blasting, drilling, and material handling for starter pits • Construction of Project-owned roads • Construction of the transmission line • Construction of the freshwater supply system • Construction of TSF dams, and interim environmental control dam (ECD) • Material handling/re-handling at Lower and Upper Waste stockpiles, LGO and topsoil stockpiles, borrow areas, and laydown areas • Construction of water management structures (e.g., diversion channels) • Aggregate extraction from borrow pits • Borrow and aggregate screening areas • Concrete batch plants • Parking lot and road grading	• Pit slopes • Surface blasting and mining activities during open pit operations • Ore extraction in the open pit • Ore transport to the processing plant • Ore processing • Construction of TSF Main Dam D and Final ECD • Wind erosion from exposed TSF beach and stockpiles • Land clearing and earthworks associated with production ramp ups • Use of unpaved surfaces including the mine site haul roads • Material handling/ re-handling at Lower and Upper Waste stockpiles, LGO and topsoil stockpiles, borrow areas, and laydown areas • Borrow and aggregate screening areas • Parking lot and road grading	• Pit slopes • Earthworks, land forming and soil stockpile rehandling • Use of unpaved mine site roads • Wind erosion from exposed TSF beach • Parking lot and road grading	• Pit slopes above inundation level • Use of unpaved mine site roads • Parking lot and road grading • Final decommissioning and closure of all remaining infrastructure

Table 6-2: Fugitive Dust Emission Sources by Project Component

Component	Location	Potential Source	Dust-generating Material	Generating Conditions	Additional Comments
Open Pit	Figure 6-1	OVB and waste rock removal, blasting, drilling, material handling/re-handling, vehicle traffic	OVB, waste rock, ore, aggregate, waste rock	Any conditions	Pit will become deeper and wetter as it is developed, mitigating fugitive dust

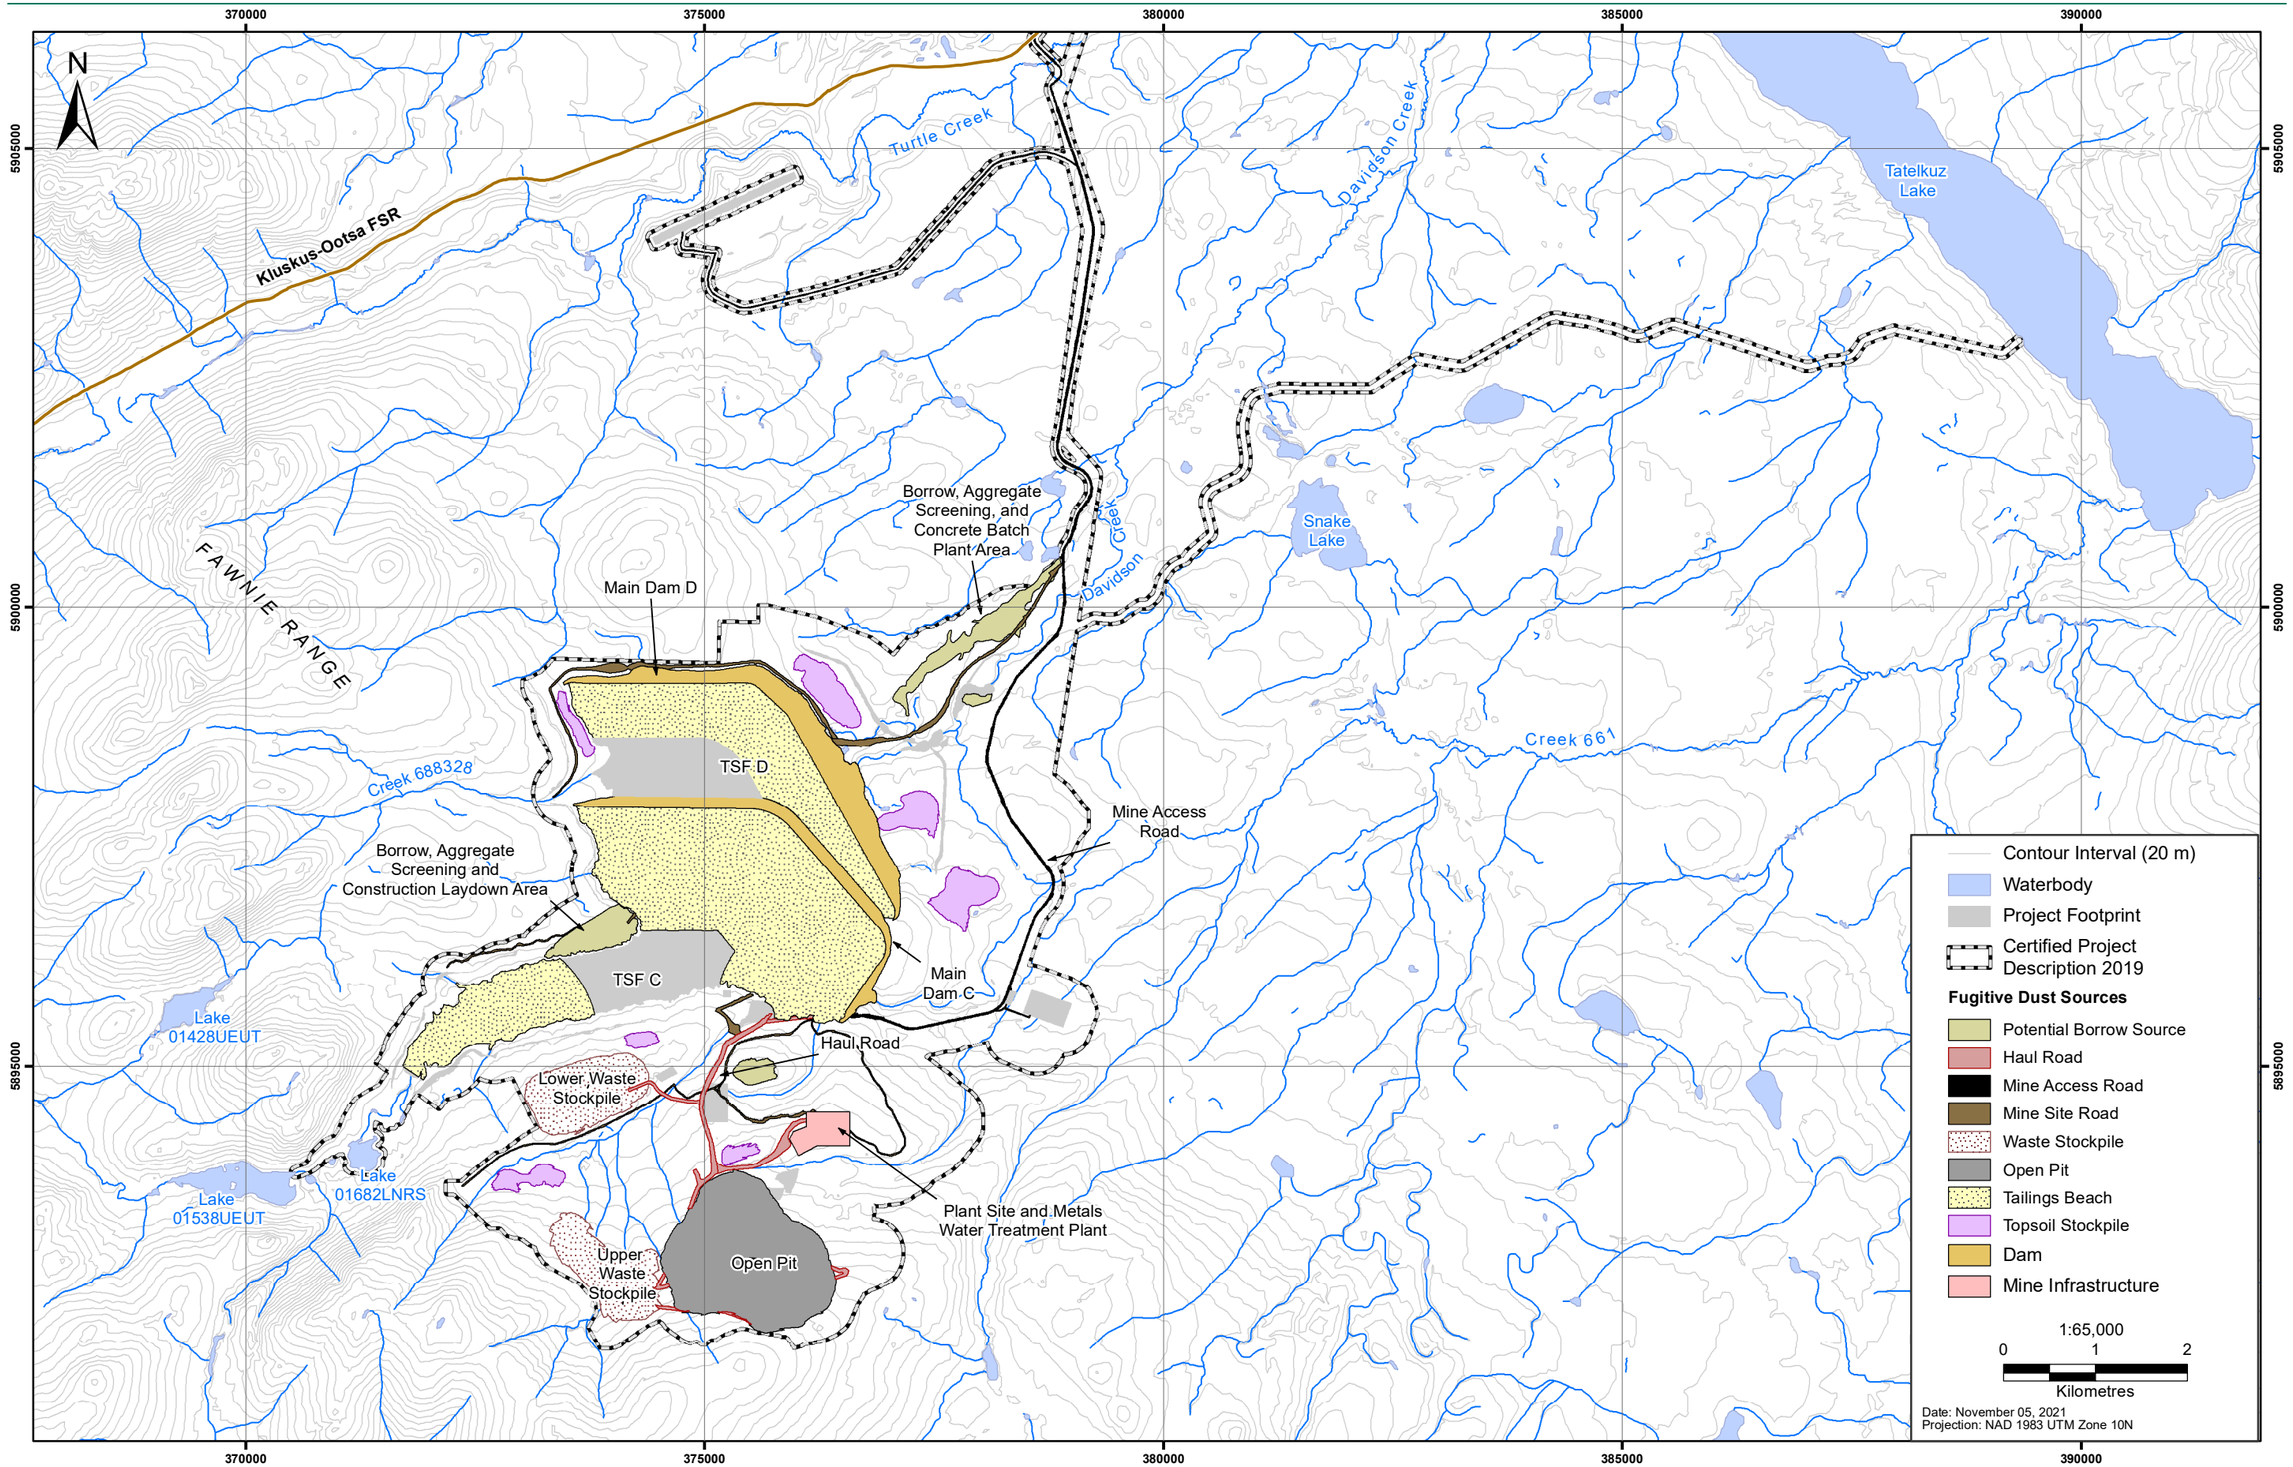

Figure 6-1: Project Components with Potential to Generate Fugitive Dust

7.0 Identification of Potential Effects of Fugitive Dust

7.1 Air Quality Objectives and Parameters of Concern

The *Canadian Environmental Protection Act, 1999* establishes National Ambient Air Quality Objectives (NAAQOs) and Canadian Ambient Air Quality Standards (CAAQS) to protect human health and the environment. BC has established Ambient Air Quality Objectives (AAQOs) pursuant to the Environmental Management Act. Federal and BC air quality objectives are provided in Table 7.1-1 and are non-legally binding limits. As even low levels of air pollution can affect some individuals, air quality objectives should not be viewed as levels that can be 'polluted up to', but levels to stay well below. Additionally, Permit #110650 includes limits on the discharge of contaminants from point sources.

Table 7.1-1: Federal and BC Ambient Air Quality Objectives

Contaminant	Averaging Period	Objectives/Standards (µg/m^3)				
		Federal[a,b,c,d]			British Columbia[e]	
		Maximum Desirable	Maximum Acceptable	Maximum Tolerable	BCAAQO[f]	CAAQS[g]
TSP	24-hour	-	120	400	120	
	Annual	60	70	-	60[h]	
PM_{10}	24-hour	-			50	
$PM_{2.5}$	24-hour	27 to 28[i]			25[j]	28[k]
	Annual	8.8 to 10[l]			8[m]	10[n]
CO	1-hour	15,000	35,000	-	14,300	
	8-hour	6,000	15,000	20,000	5,500	
NO_2	1-hour	79 to 113[o]			188[p]	113[q]
	Annual	23 to 32[r]			60[s]	32
SO_2	1-hour	170 to 183[t]			196[u]	183[v]
	Annual	10 to 13[w]			13[x]	

Sources: [a] CCME 1999, [b] Government of Canada 2013, [c] Government of Canada 2017a, [d] Government of Canada 2017b, and [e] ENV 2020.

Notes:

µg/m^3 = micrograms per cubic metre; mg/dm^2/d = milligrams per square decimetre per day; TSP = total suspended particulate; PM_{10} = Particulate matter less than 10 µm (microns) in diameter; $PM_{2.5}$ = Particulate matter less than 2.5 µm (microns) in diameter; CO = carbon monoxide; NO_2 = nitrogen dioxide; SO_2 = sulphur dioxide

"-" signifies that no air quality objective is available.

[f] BC AAQO.

[g] CAAQS.

[h] Based on geometric mean.

[i] CAAQS is 28 µg/m^3 in 2015 and 27 µg/m^3 in 2020 (CCME 1999); compliance based on annual 98th percentile value, averaged over three consecutive years.

(j) Achievement based on annual 98th percentile of daily average, over one year.

(k) Achievement based on annual 98th percentile of daily average, averaged over three consecutive years.

(l) CAAQS is 10 µg/m³ in 2015 and 8.8 µg/m³ in 2020 (CCME 1999); compliance based on the average over three consecutive years.

(m) Achievement based on annual average, over one year. There is a planning goal of 6 µg/m³.

(n) Achievement based on annual average, averaged over three consecutive years.

(o) CAAQS is 113 µg/m³ from December 2017 through December 2024 and 79 µg/m³ as of January 2025 (Government of Canada 2017a); compliance based on a three-year average of the annual 98th percentile of the daily 1-hour maximum concentration (D1HM).

(p) Interim provincial AAQO, currently under review. Achievement based on annual 98th percentile of D1HM, over 1 year.

(q) Achievement based on annual 98th percentile of D1HM, averaged over three consecutive years.

(r) CAAQS is 32 µg/m³ from December 2017 through December 2024 and 23 µg/m³ as of January 2025 (Government of Canada 2017a); compliance based on a one-calendar-year average of all the 1-hour average concentrations.

(s) Interim provincial AQO, currently under review.

(t) CAAQS is 183 µg/m³ from October 2017 through December 2024 and 170 µg/m³ as of January 2025 (Government of Canada 2017b); compliance based on a three-year average of the annual 99th percentile of the daily-maximum 1-hour average concentrations.

(u) Achievement based on annual 97th percentile of D1HM averaged over 2015-2017, annual 97.5th percentile of D1HM averaged over 2016-2018 and annual 98th percentile of D1HM averaged over 2017-2019, with one allowable excursion above 75 ppb to a maximum of 85 ppb over a three-year period prior to 2020. Superseded by CAAQS level and metric January 1, 2020.

(v) Achievement based on annual 99th percentile of D1HM, averaged over three consecutive years, effective January 1, 2020. Used to inform new air management decisions beginning January 1, 2017 and all air management decisions beginning January 1, 2020.

(w) CAQQS is 13 µg/m³ from October 2017 through December 2024 and 10 µg/m³ as of January 2025 (Government of Canada 2017b); compliance based on a one-calendar-year average of all the 1-hour average concentrations.

(x) Used to inform new air management decisions beginning January 1, 2017 and all air management decisions beginning January 1, 2020.

Particulate matter ($PM_{2.5}$ and PM_{10}) are the main parameters of concern for mining operations as they relate to human health. For the Project's human health risk assessment (HHRA), emissions of nitrogen oxides, SO_2, CO and PM ($PM_{2.5}$ and PM_{10}) were modelled to estimate concentrations at each human receptor location (including full-time residents, temporary land users and off-duty workers) for comparison with BC objectives (Entia 2021). The HHRA considered estimated metal concentrations in dust that is predicted to be deposited at soils and vegetation sampling locations.

Figure 7.1-1 identifies sensitive receptors in relation to the Project. The closest on-site receptor is the operations camp which will house off-duty workers (Figure 7.1-1). The closest off-site receptor is Tatelkus Lake Indian Reserve 28 (Tatelkus Lake 28), located approximately 5.8 km northeast of the mine site (Figure 5.1-1). Onsite and offsite wildlife and vegetation receptors are assessed with human health and environment impacts when applying BC objectives when dust is deposited on soils and vegetation.

To minimize air emission impacts from the Project to human health and the environment mitigations and monitoring will be implemented as described in Section 8. Visual monitoring of dust will be completed onsite at active earthworks, haul roads, and stockpiles.

Air dispersion modelling was conducted to predict concentrations of parameters of concern.

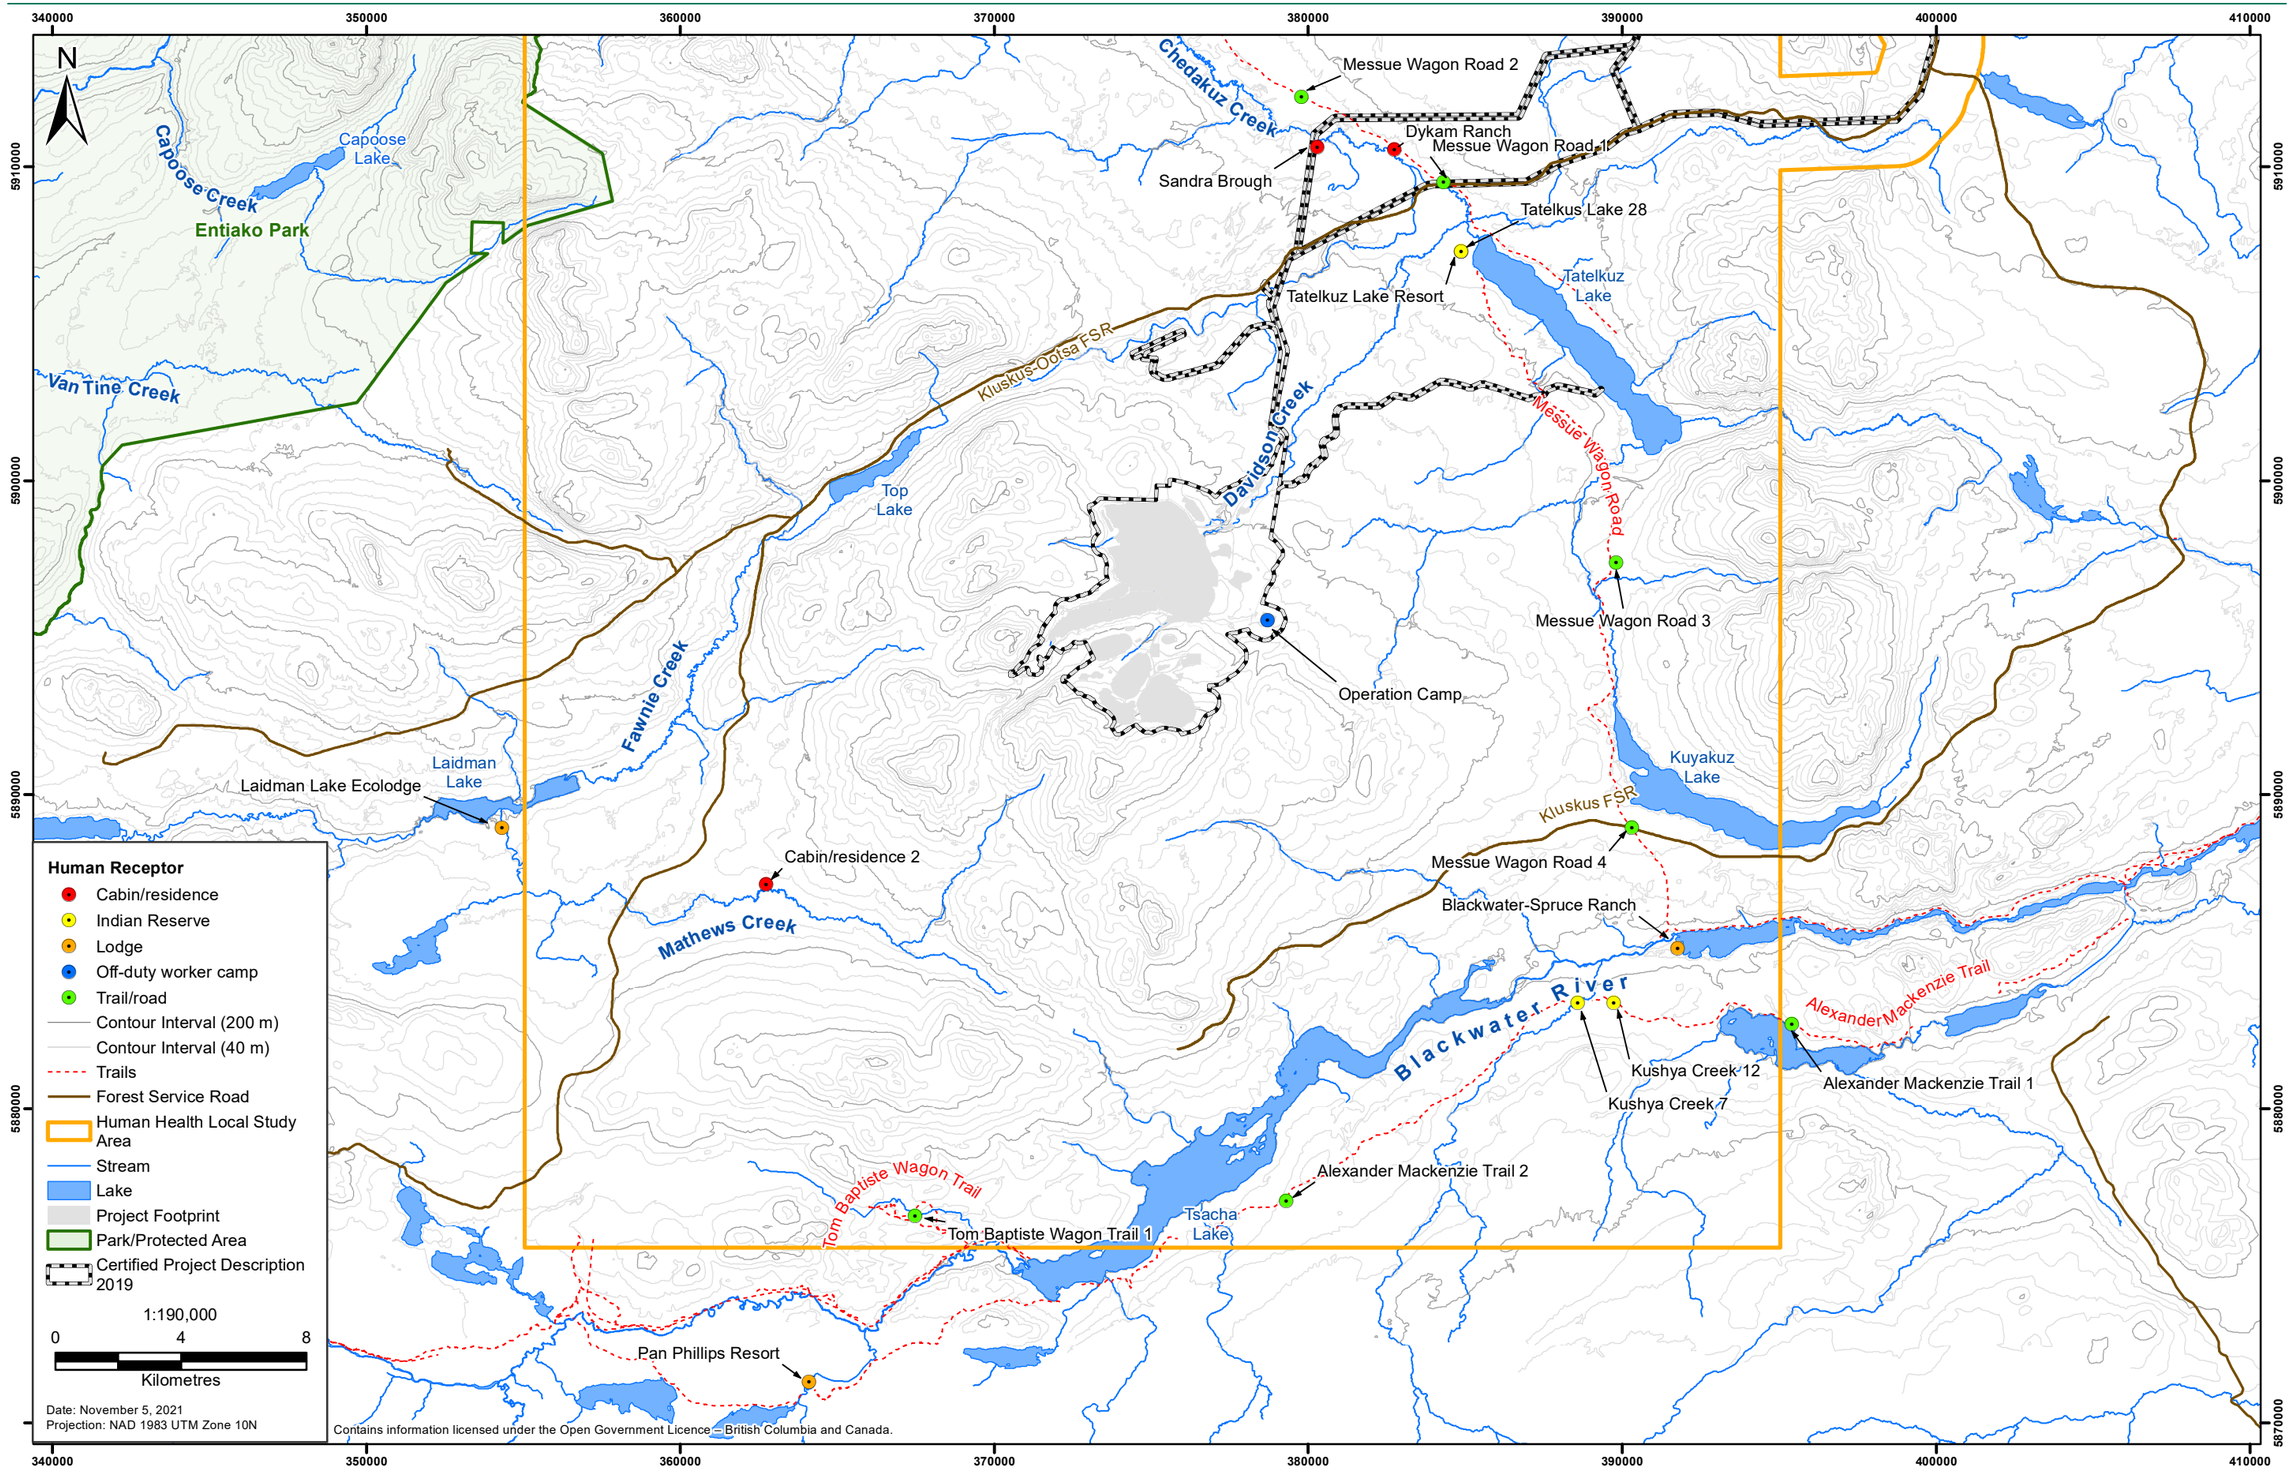

Figure 7.1-1: Air Quality Human Receptors

7.2 Air Dispersion Modelling Results and Effects

Modelling results represent a Level 3 assessment using the CALPUFF modelling system. The CALPUFF modeling system was used to prepare meteorological data, model concentrations and deposition, and to post-process results for specific pollutants and applicable averaging periods. CALPUFF was run using 2011 meteorology data. The results presented below represent predicted concentrations during the Phase 1 of the Project.

Table 7.2-1 summarizes the results of air dispersion modelling for all off-site human receptor locations, and Table 7.2-2 summarizes the results of air dispersion modelling for the operations camp. The results at all off-site receptor locations indicate there are no exceedances of applicable ambient air quality objectives, with all results being less than 80% of the objectives and hence are not considered parameters of potential concern (POPC).

Table 7.2-1: Baseline Case and Project Case Concentrations for Criteria Air Contaminants for All Off-site Receptor Locations

Parameter	Averaging Period	Concentration (µg/m^3)			AAQO (µg/m^3)	POPC?	POC?
		Baseline Case	Project Only	Project Case			
$PM_{2.5}$	24-hour	4	0.4	4.4	25	No	No
	Annual		0.1	4.1	8	No	No
PM_{10}	24-hour	9	2	11	50	No	No
NO_2	1-hour	8	5	13	79	No	No
	Annual		0.3	8.3	23	No	No
SO_2	1-hour	2	1.0	3.0	170	No	No
	Annual		0.03	2.0	10	No	No
CO	1-hour	120	30	150	14,300	No	No
	8-hour		12	132	5,500	No	No

Table 7.2-2: Baseline Case and Project Case Concentrations for Criteria Air Contaminants at the Operations Camp

Parameter	Averaging Period	Concentration (µg/m^3)			AAQO (µg/m^3)	POPC?	POC?
		Baseline Case	Project Only	Project Case			
$PM_{2.5}$	24-hour	4	3.6	7.6	25	No	No
	Annual		1.0	5.0	8	No	No
PM_{10}	24-hour	9	17.9	26.9	50	No	No
NO_2	1-hour	8	29.1	37.1	79	No	No
	Annual		1.8	9.8	23	No	No

Parameter	Averaging Period	Concentration (µg/m^3)			AAQO (µg/m^3)	POPC?	POC?
		Baseline Case	Project Only	Project Case			
SO_2	1-hour	2	6.6	8.6	170	No	No
	Annual		0.2	2.2	10	No	No
CO	1-hour	120	197.5	317.5	14,300	No	No
	8-hour		85.0	205.0	5,500	No	No

Notes:

$PM_{2.5}$ = particulate matter less than 2.5 µm in diameter; PM_{10} = particulate matter less than 10 µm in diameter

NO_2 = nitrogen dioxide; SO_2 = sulfur dioxide; CO = carbon monoxide

AAQO = Ambient Air Quality Objective, based on the most conservative BC AAQO or CAAQS (including standards anticipated for 2025)

POPC = Parameter of Potential Concern, identified if the parameter concentration is higher than 80% of the AAQO.

POC = Parameter of Concern, identified if the parameter concentration is higher than the AAQO.

Baseline Case concentrations are from Table 2.2-4 in Chapter 2 of the Application.

Project Case concentrations include both background and Project contributions.

The HHRA (Entia 2021) found that predicted 24-hour ground-level $PM_{2.5}$ and PM_{10} concentrations do not result in any acute short-term exposure hazard quotient (HQ) values above 1.0 for any of the offsite sensitive receptor locations. The highest HQ values for 24-hour $PM_{2.5}$ and PM_{10} are 0.176 and 0.225 respectively, at Tatelkuz Lake Resort and Tatelkus Lake 28. The contributions of Project emissions to the total HQ for 24-hour $PM_{2.5}$ and PM_{10} are 0.016 and 0.045 respectively, based on the effects assessment. At the operations camp, the highest HQ values for 24-hour $PM_{2.5}$ and PM_{10} are 0.304 and 0.539, respectively. The contributions of Project emissions to the total operations camp HQ for 24-hour $PM_{2.5}$ and PM_{10} are 0.144 and 0.359 respectively, based on the effects assessment. Adverse health effects for human receptors are unlikely to occur following acute short-term exposures to $PM_{2.5}$ and PM_{10}.

Predicted annual ground-level $PM_{2.5}$ concentrations do not result in any chronic HQ values above 1.0 for any of the receptor locations. The highest HQ value for annual chronic exposure to $PM_{2.5}$ at any offsite sensitive receptor is 0.512 at Tatelkuz Lake Resort and Tatelkus Lake 28. The contribution of Project emissions to the total HQ for annual chronic exposure is 0.012 based on the effects assessment. At the operations camp, the HQ value for annual chronic exposure to $PM_{2.5}$ is 0.629 with a contribution from Project emissions of 0.129. These values show that the contribution of Project emissions to the total HQ is small – maximum of 2% for offsite receptors, 21% at the operations camp, Since the total HQ values for the baseline condition and effects assessment remain less than 1.0, adverse health effects for human receptors are unlikely to occur following chronic exposure to $PM_{2.5}$.

Particulate emissions can have effects on aquatic resources and fish, vegetation, wildlife, and human health. Potential effects on the aquatic environment from dust include increase in turbidity levels which could affect habitat quality and organism health. Deposition of dust can lead to contamination of soils with metals, which may adversely affect vegetation abundance, composition, nutritional value, and toxicity. Fugitive dust can cause physical injuries to vegetation, including the alteration of photosynthetic receptors, respiration, and transpiration. Potential effects to wildlife and people include health effects from ingestion of plants and/or animals that have been exposed to chemicals contained with the dust.
The amount of dust generated by haul trucks and mining equipment depend on a variety of factors including road material, waste rock moisture content, chemical composition, and the amounts of particulates ready to be emitted, known as silt content. The distance the particles will travel depends on

particle size distribution (bigger particles are deposited to the ground closer to the source) and meteorological conditions. With higher winds, the higher mass concentration of larger size particles increases faster than smaller sized particles. (Haller et al. 1999).

Naturally occurring small particulates produced by forest fires can elevate $PM_{2.5}$ and PM_{10} levels above guidelines.

8.0 Implementation

The following sections present the mitigation measures, training, and monitoring that will be implemented to manage fugitive dust and confirm mitigation measures are working.

8.1 Training and Awareness

Employees and contractors will receive awareness-level training in fugitive dust management and air quality on their arrival on site through an environmental on-boarding training session and prior to the start of work as part of the Site Orientation. The purpose of this training is to provide all site personnel with a basic level of environmental awareness and an understanding of their obligations regarding compliance with regulatory requirements, commitments, and best practices. A refresher training will be provided to employees and contractors on an annual basis. Refresher training may take the form of periodic re-training through tailgate and safety meetings.

Site supervisors will be responsible for understanding and implementing the AQDMP and operational SOPs with respect to their individual work areas. The EM will ensure additional training and advice is provided as needed. Targeted training related to dust management will be provided to individuals and/or groups of workers assuming a specific authority or responsibility related to air quality. This training will be delivered by means of classroom instruction, toolbox/tailgate meetings or other means as appropriate.

BW Gold will regularly review and update the training and awareness plan based on changes in training needs and regulatory requirements.

8.2 Mitigation Measures

Site-specific mitigation measures, including best management practices, will be applied to all dust sources as listed in Table 8.2-1. If measures are ineffective, contingency measures are also proposed, where relevant. Visual monitoring of dust onsite will be carried out in source areas of dust generation, where dust has potential of leaving the site.

Table 8.2-1: Air Quality Mitigation Measures, Best Management Practices, and Contingency

Emission Source	Best Management Practices and Mitigation Measures	Contingency
Open Pit	• Employees involved in material handling or management will receive instruction by a qualified person on the importance of minimizing material drop height (from excavator to truck, conveyor to stockpile, etc.) to reduce fugitive dust, noise, and vibration. • Utilize available fleet of water trucks, weather depending. • Use weather forecasts to inform blasting plan (e.g., wind forecast, lightning and thunder warnings).	n/a
Production drilling	• Use wet drilling during very dry conditions (less than 0.25 mm/day of precipitation in the previous week).	n/a
Production blasting	• Immediately prior to blasting, the “Drill and Blast Engineer / Blast Coordinator” will check weather conditions to determine if the blast is likely to cause any dust or fume impacts on the surrounding environment.	n/a

Emission Source	Best Management Practices and Mitigation Measures	Contingency
	• Blasting may be postponed until wind direction is not forecast to disperse emissions towards employees or local sensitive receptors when dust or fume impacts on employees and environment cannot be avoided. The Mine Drill and Blast Superintendent and Mine manager will ultimately decide when to postpone blasting (the H&S Manager and The Project Occupational Health and Safety Program can inform this decision).	
Concrete batch plants	• When unloading material, piles should form low piles (target height of approximately 10 m) that extend horizontally, where practical. • Employees involved in material handling or management will receive instruction by a qualified person on the importance of minimizing material drop height (from excavator to truck, conveyor to stockpile, etc.) to reduce fugitive dust, noise, and vibration.	n/a
Aggregate crushing and screening areas	• Equip the crusher and/or screener circuits with onboard water dosing during times of the year above freezing temperatures or other dust suppression measures (e.g., reagents) systems. • Apply water when temperatures are above freezing and there are very dry conditions (less than 0.25 mm/day of precipitation in the previous week). • Stockpiles should form low piles (target height of approximately 10 m) that extend horizontally as determined by the Construction Manager, where practical. • Use screener and crusher covers. • Check cover for tears, holes and cracks on a monthly basis. Repair as soon as possible.	n/a
TSF, Site C and Site D Main dams, Site C Saddle and West dams	• Advance planning of weekly workload activities. • Apply water in non-freezing, very dry conditions (less than 0.25 mm/day of precipitation in the previous week).	• Maintain higher water levels • Application of calcium chloride, magnesium chloride or other approved dust suppressants during freezing conditions[1]
Freshwater Reservoir and dam	• Advance planning of weekly workload activities. • Apply water in non-freezing, very dry conditions (less than 0.25 mm/day of precipitation in the previous week).	• Application of calcium chloride or magnesium chloride during freezing conditions[1]
Borrow areas	• Apply water when temperatures are above freezing and there are very dry conditions (less than 0.25 mm/day of precipitation in the previous week). • Employees involved in material handling or management will receive instruction by a qualified person on the importance of minimizing material drop height (from excavator to truck, conveyor to stockpile, etc.) to reduce fugitive dust, noise, and vibration. • Develop new borrow areas only when and as required (to be determined by the Mine Manager).	n/a

Emission Source	Best Management Practices and Mitigation Measures	Contingency
	• Once suitable materials have been salvaged, place topsoil on disturbed areas and seed once they are sloped to final grade and at an appropriate time of year for seeding using a native seed mix to re-establish vegetative cover as soon as reasonably possible. • When unloading material, piles should form low piles (target height of approximately 10 m) that extend horizontally. • Minimize drop height from loaders and excavators (shovels) to the truck.	
Processing Plant	• Apply water when temperatures are above freezing and there are very dry conditions (less than 0.25 mm/day of precipitation in the previous week). • Use screener and crusher covers. • Employees involved in material handling or management will receive instruction by a qualified person on the importance of minimizing material drop height (from excavator to truck, conveyor to stockpile, etc.) to reduce fugitive dust, noise, and vibration. • Baghouse, control emissions from fully enclosed conveyor. • Enclose conveyors. • Check cover for tears, holes and cracks on approved inspection and maintenance schedule. Repair or replace as soon as possible.	n/a
Low Grade Ore Stockpile	• When unloading material, stockpile lifts should form low piles (target height of approximately 10 m) that extends horizontally and conform to the stockpile design report (MMTS 2021).	n/a
Topsoil stockpiles	• When unloading material, the piles should form low piles (target height of approximately 10 m) that extend horizontally (MMTS 2021). • Seed stockpiles once they are sloped to final grade and at an appropriate time of year for seeding to reduce erosion and establishment of invasive species.	n/a
MAR	• Speed limits will be established based on road design class, with the maximum speed limit of 50 km/h on all Project roads. • Reduce speed limits on the mine access road if weather conditions cause fugitive dust emissions and dust cannot be controlled by watering. • Speed limits are clearly marked through signage and enforced by site security Personnel caught speeding may face disciplinary measures, and if violators are encountered they will be provided with constructive instruction on the importance of adhering to speed limits to limit dust generation. • Manage dust emissions from roadways in accordance with the Fugitive Dust Management SOP[2]. • Water roads in accordance with Section 5.1.1 (Watering) of the Fugitive Dust Management SOP. • Apply dust suppressant reagents after spring melt (e.g., calcium chloride, magnesium chloride or other equivalent) as approved by the Mine Manager. • Grader maintenance with road crush as required. • Regular compaction. • Use coarse aggregate on roads with low silt content to reduce silt loading on roads.	n/a

Emission Source	Best Management Practices and Mitigation Measures	Contingency
TSF and mine haulage and service roads	• Speed limits will be established based on road design class, with the maximum speed limit of 50 km/h on all Project roads. • Reduce speed limits on Project-owned roads if weather conditions cause fugitive dust emissions and dust cannot be controlled by watering. • Speed limits are clearly marked through signage and enforced by site security Personnel caught speeding may face disciplinary measures, and if violators are encountered they will be provided with constructive instruction on the importance of adhering to speed limits to limit dust generation. • Manage dust emissions from roadways in accordance with the Fugitive Dust Management SOP[2]. • Visual inspection for dust emissions from roadways and active stockpiles – mine and Infrastructure supervisors, or designate, as well as the mine dispatch office who have a number of real-time stationary but rotating cameras with multiple angles of the open pit and haul roads will monitor for visible emissions from the trucks equipment, and active stockpiles on the site during moderate weather conditions. A hot, dry day is defined as a day with less than 0.25 mm of rainfall for the preceding 24 hours and a temperature greater than 20 ºC. • Utilize available fleet of water trucks, weather depending (non-freezing conditions). • Apply dust suppressant reagents after spring melt (e.g., calcium chloride, magnesium chloride or other equivalent) as approved by the Mine Manager. • Use coarse aggregate on roads with low silt content to reduce silt loading on roads. • Grader maintenance with road crush as required. • Regular compaction.	• Trial installation of a fog/sprinkler system that releases small droplets of water on roadways to supress airborne dust and not cause water seepage on high traffic haul roads (e.g., primary crusher ramp, stockpile access roads).
Primary and secondary crusher circuits, conveyors and stockpile drop points	• Install spray bar sprinklers at material transfer points to limit dust emissions. • During periods of air temperatures below 0 ºC, reagents can be used to limit the formation of frost balls.	n/a
Loads in transit in open beds.	• Install removable tarps to cover truck loads of fine material if possible. • Use tackifiers, if necessary, to limit fugitive dust from loads of fine material.	n/a
Vehicles	• Maintain equipment in good working condition according to manufacturer's recommendations. • Restrict speeds and reducing idling (no-idling policy will be implemented, except for situations such as extenuating circumstances during the winter where cold starts and stopping could wear on mining equipment or the vehicle is being used as refuge for lunch or breaks on hot summer days). • Use Tier IV engines for mine fleet.	n/a

Notes:

n/a – not applicable.

[1] BW Gold will follow guidance from the BC best practice manual on fugitive dust management, (https://www2.gov.bc.ca/assets/gov/environment/waste-management/industrial-waste/industrial-waste/mining-smelt-

energy/guidance-documents/dust_management_plan_guidance.pdf), which refers to the best management practice manual from the NWT: (https://www.enr.gov.nt.ca/sites/enr/files/guidelines/dustsupression.pdf).

The application rate of dust suppressant will be carefully monitored to provide adequate coverage without pooling or runoff of products. The amount of dust suppressant applied will not exceed the minimum amount required to effectively suppress dust. Dust suppressant will be bladed or incorporated into the road immediately upon application, to limit the potential of product migrating off the roadway. There will be no evidence of excess product on the roadway. The dust suppressant will not migrate or run off the traveled portion of the roadway.

[2] BW Gold will maintain the most current version of the Fugitive Dust Management Plan SOP at the mine site.

8.3 Monitoring

The air quality monitoring program will be initiated prior to the start of construction and remain in place during all phases of the Project. Figure 8.3-1 illustrates the existing and planned monitoring sites, with further details provided in the following sections.

8.3.1 Meteorological Stations

There are two existing, automated meteorological stations (Figure 8.3-1). Table 8.3-1 provides information on the locations, parameters measured, and the available period of data. Prevailing winds have historically been observed to come from the west (see Section 5.2), which can cause fugitive dust events.

The parameters identified in Table 8.3-1 will be monitored over all phases of the Project. Data, continuously collected by the units, will be downloaded following procedures in the Climate Station Operational and Quality Assurance Plan and reviewed by BW Gold employees overseen by the Environmental Manager at a minimum of a monthly basis. Data will be reviewed according to guidance in Water and Air Baseline Guidance Document for Mine Proponents and Operators (BC MOE 2016c).

The meteorological stations will follow the Station Operational and Quality Assurance Plan as required by air discharge permit #110650.

8.3.2 Dustfall Monitoring

According to ENV 2020, dustfall monitoring and the dustfall Pollution Control Objectives have outdated methodology and criteria and are no longer recommended by BC ENV. Instead, it is recommended with the objective to protect human health, monitoring particulates are more appropriate. To protect soil, water and vegetation, sampling specific media such as metal concentrations from particulate matter from air or metals in water from the surface water management and metal concentration sampling from vegetation in vegetation management is more appropriate. Therefore, air quality and fugitive dust monitoring will include both particulate sampling and analysis of particulate matter metal concentrations as detailed in the Country Foods Monitoring Program. In addition. visual monitoring of dust will be undertaken.

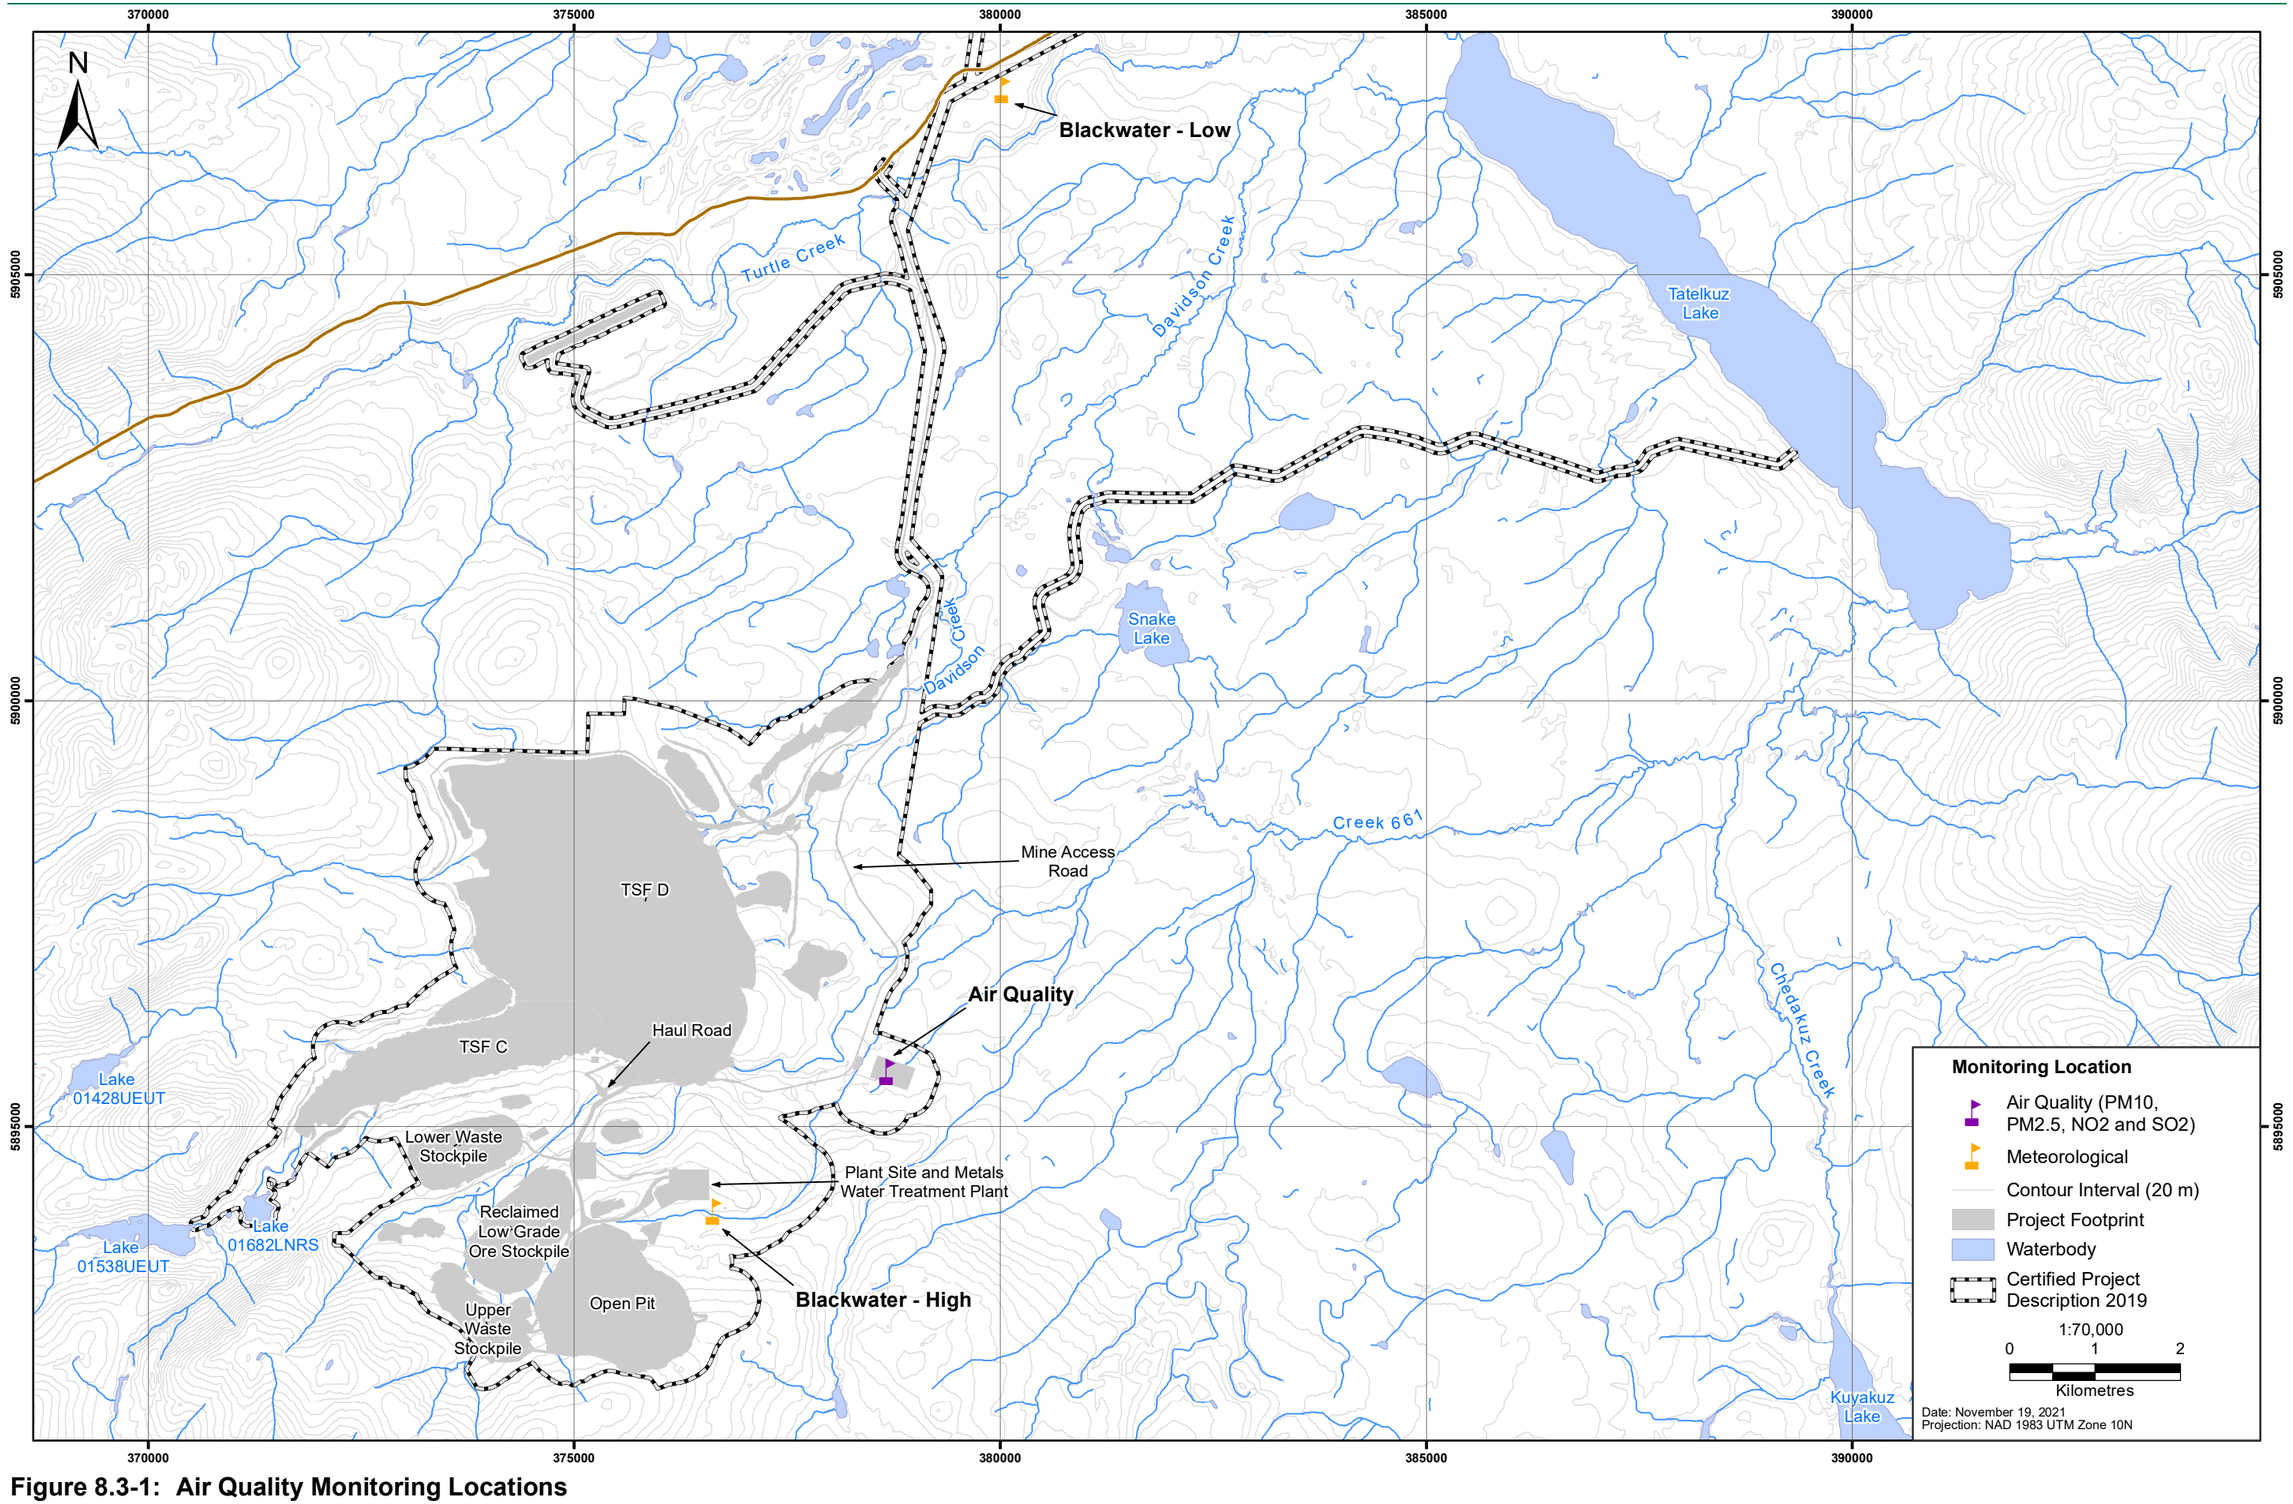

Figure 8.3-1: Air Quality Monitoring Locations

Table 8.3-1: Blackwater Project Meteorological Stations

Station Name (EMS No.)	Station Height	Latitude (deg N)	Longitude (deg W)	Elevation (masl)	Meteorological Parameters Monitored	Data Period Available
Low (E331132)	10 m	53.29979	124.80025	1,050	Air temperature, relative humidity, precipitation, wind speed and direction, barometric pressure, snow depth, net radiation, solar radiation	August 2011 - present
High (E331133)	10 m	53.18113	124.84620	1,470	Air temperature, relative humidity, precipitation, wind speed and direction, barometric pressure, snow depth, net radiation, solar radiation	July 2012 - present

Mine personnel will be trained to be observant for dust related concerns which may arise. These observations, together with meteorological conditions and mitigation efforts taken to deal with an issue, will be recorded and included in annual reports. Dust visual monitoring will focus on areas where there are active surface earthworks, haul roads and overburden, and soil stockpiles.

Visual monitoring will occur at all locations where fugitive dust generation is occurring.

The visual dust monitoring program is intended to contribute to:

- visual identification and recording of fugitive dust events;
- assessment of the effectiveness of mitigation and management measures;
- identification of effects requiring further mitigation efforts; and
- compliance with permit, approvals, and regulatory requirements.

The visual monitoring program will consist of visual observations and documentation of fugitive dust by mine personnel. During periods of wind greater than 5 m/s and when the ground is not covered under snow, Departmental Managers responsible for the areas listed will perform visual monitoring for dust at the following locations:

- locations of active surface earthworks;
- active haul roads; and
- overburden and soil stockpiles.

In addition to these regular inspections mine personnel will be directed to inform Departmental Managers if persistent dust plumes are visible.

Inspections will not be recorded under level “none” described in the Trigger Action Response table (see Table 9.1-1). For Level “Medium” or “High” Alert events in the Trigger Action Response Table, after inspections are complete, a log of the findings will be filled out by the Departmental Manager referenced above. The log will contain information on the location where dust plumes were visible, their approximate size and temporal persistence, activities occurring that may have caused the dust plume, meteorological conditions at the time and any actions taken.

Monitoring will be conducted by competent personnel as designated by the Environment Manager. Data will be reported in compliance with Permit #110650 requirements and are kept and made available to others for review upon request.

8.3.3 Particulate Matter Monitoring

A Thermo Scientific Partisol-FRM Model 2025i-D PM sampler will be installed on the mine site at the exploration camp before the start of major works construction and moved to the operations camp at the start of operations. The camp is the nearest sensitive receptor to mine operations. The station will measure PM < 10 microns (PM_{10}) and PM < 2.5 microns ($PM_{2.5}$) mass concentrations on a 47 mm filter contained in a single-action filter change mechanism.

Samples will be collected over a 24-hour period at a target flow rate of 1 m^3/h. Sample volumes will be recorded and divided into the mass concentration to yield a 24-hour average concentration in units of µg/m^3. The Partisol sampler is suitable for a wide variety of climate conditions and meets the United States Environmental Protection Agency guidelines for manual air samplers.

Fine particulate sampling will occur every third day for $PM_{2.5}$ and PM_{10}, between May and October. During November to April, sampling occur for $PM_{2.5}$ and PM_{10} on a six (6) day basis.

The location of Partisol monitoring is expected to change in 2024 with the development of a permanent operations camp.

8.3.4 Nitrogen Dioxide and Sulfur Dioxide Monitoring

Nitrogen dioxide (NO_2) and SO_2 will be sampled using a passive air sampling system (PASS) whereby gas pollutants are monitored by passive diffusion through a diffusive surface onto an adsorbent membrane or filter. PASS monitors will be installed at the exploration camp prior to the start of major works construction and at the operations camp at the start of operations.

Monitors will be under a protective rain shelter, attached to a supporting pole. Site personnel will collect and replace the PASS units approximately every 15 days and submit the units to an accredited laboratory for analysis.

PASS laboratory results will be reviewed for sample integrity issues and erroneous data. Field notes, chains of custody, comments from the laboratory, and professional judgement will also be considered during the review process. Invalid data will be omitted from final analyzed datasets. Because PASS sampling is passive, hourly NO_2 and SO_2 concentrations cannot be sampled using this method and therefore will not be compared against the hourly CAAQS.

The location of PASS monitoring is expected to change in 2024 with the development of a permanent operations camp.

8.3.5 Carbon Monoxide

Based on the air dispersion modelling results, predicted CO levels are below BC air quality objectives at the human receptor locations (i.e., less than 5% of the objective). The maximum 1-h CO concentration at any human receptor is 317 ug/m^3 while the objective is 14,300 ug/m^3. The maximum 8-h CO concentration is 205 ug/m^3 while the objective is 5,500 ug/m^3.

CO monitoring is normally not recommended for these low levels; however, CO monitoring is a requirement of the DS Condition #6.12. CO will be sampled using an appropriate sampling methodology.

8.3.6 Point Source Discharge Monitoring

The following point source monitoring will be undertaken as per Table 8.3-2, and the results thereof submitted to ENV as part of annual reporting requirements under the air emissions permit. The sampling and analyses must be conducted once in the first six months of operation, and then once every five years, under normal operating conditions. A minimum of five days prior to each event, the EM will notify ENV that sampling is scheduled.

Table 8.3-2: Blackwater Project Point Sources

Source	Parameter	EMS No.
Primary Crusher	Total Particulate Matter	E328676
Secondary Crusher	Total Particulate Matter	E328677
Tertiary Crusher	Total Particulate Matter	E328679
Reclaim Tunnel	Total Particulate Matter	E328680
Fire Assay Lab	Total Particulate Matter	E328687
Fire Assay Sample Prep Area	Total Particulate Matter	E328686
Cyanide Prep Area	Total Particulate Matter	E328683
Copper Sulphate Mix Tank	Total Particulate Matter	E328684
Incinerator	Total Particulate Matter	E328685

The baghouses and dust suppression systems will be operated and maintained in accordance with the manufacturer's specifications.

The operating pressure drop for the baghouses will be maintained within the design conditions specified by the manufacturer's performance warranty. The baghouses will be equipped with a gauge or meter, which indicates the pressure drop across the control device. If the manufacturer's specifications are unavailable then the pressure drop will not be less than 1.0 inches of water column or more than 10.0 inches of water column.

BW Gold will comply with the manufacturers recommended schedule for inspecting and maintaining control equipment. If the inspection frequency is not specified by the manufacturer, recommended inspection and maintenance activities will be conducted at least once per quarter.

8.3.7 Quality Assurance / Quality Control

The quality assurance/quality control (QA/QC) program for air quality will include:

- Use of standard field data sheets and SOPs (e.g., for calibration of the Partisol and PASS sampling equipment) for field sampling and data collection;
- Review of data once transferred to a database to minimize the potential for transcription errors;
- Appropriate training for field personnel responsible for collecting samples;
- Use of chain of custody (COC) forms and CALA-accredited laboratory for analysis of samples; and
- Appropriate laboratory-based QA/QC programs, consistent with the requirements of the British Columbia Environmental Laboratory Manual (BC ENV 2020a).

8.4 Community Feedback Mechanism

Pursuant to DS Condition 6.3, BW Gold will establish a feedback mechanism to manage input and complaints related to exposure to dust from the Project during construction, operation and decommissioning. Complaints may arise from Project-related use of the FSRs between Vanderhoof and the Project site. Monitoring activities will include a review of any complaints received from the public related to fugitive dust and air quality and an initial response within 48 hours. Complaints will be carefully investigated, tracked and logged, contributing factors that may have resulted in the complaint, and any actions that were undertaken and follow-up to address the complaint. Complaints may require a more in-depth root cause analysis and result in modification of the Plan.

In the event that COPC limits and corresponding concentration triggers identified in Section 9 (Adaptive Management Trigger Action Response) of the AQDMP are exceeded, BW Gold will notify the EAO, ENV, EMLI, Northern Health and Aboriginal Groups and Independent Environmental Monitor. As required by EAC Condition 20, the notification will include both a technical report and a plain language summary of the technical report. The report will be public by posting it to the Blackwater Project website.

9.0 Adaptive Management and Follow-up Program

The AQDMP is a living document that will evolve over time in response to the results of the monitoring program, changing conditions or development at the Project, updates to scientific methods, and through consultation and discussions with Indigenous Nations, regulators, or other stakeholders. This process of continuous improvement with changing conditions is referred to as adaptive management.

Condition 6.12 of the DS requires BW Gold to develop an air quality follow-up program (AQFP) as follows:

> *The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, a follow-up program to verify the accuracy of the environmental pertains to adverse environmental effects of the Designated Project on the health of Indigenous Peoples as a result of changes to air quality and determine the effectiveness of mitigation measures. As part of the implementation of the follow-up program, the Proponent shall monitor nitrogen dioxide (NO_2), sulfur dioxide (SO_2), fine particulate matter ($PM_{2.5}$), particulate matter (PM_{10}), dust, and carbon monoxide (CO) in air. The Proponent shall implement the follow-up program during all phases of the Designated Project and shall apply conditions 2.9 and 2.10 when implementing the follow-up program.*

The federal DS requirements related to follow-up and adaptive management are:

> *"2.5 The Proponent shall, where a follow-up program is a requirement of a condition set out in this Decision Statement, have a Qualified Professional, where such a qualification exists for the subject matter of the follow-up program, determine, as part of the development of each follow-up program and in consultation with the party or parties being consulted during the development, the following information:*
>
> *2.5.1 the follow-up activities that must be undertaken by a qualified individual;*
>
> *2.5.2 the methodology, location, frequency, timing and duration of monitoring associated with the follow-up program;*
>
> *2.5.3 the scope, content, format and frequency of reporting of the results of the follow-up program;*
>
> *2.5.4 the levels of environmental change relative to baseline conditions that would require the Proponent to implement modified or additional mitigation measure(s), including instances where the Proponent may require Designated Project activities to be stopped; and*
>
> *2.5.5 the technically and economically feasible mitigation measures to be implemented by the Proponent if monitoring conducted as part of the follow-up program shows that the levels of environmental change referred to in condition 2.5.4 have been reached or exceeded.*
>
> *2.6 The Proponent shall update and maintain the follow-up and adaptive management information referred to in condition 2.5 during the implementation of each follow-up program in consultation with the party or parties being consulted during the development of each follow-up program."*

Condition 3 of the EAC requires an adaptive management plan to provide a framework for identifying triggers to determine effectiveness of mitigation and whether additional mitigation is required to address air quality effects. The adaptive management plan, as defined in Condition 3(d) to 3(l) of the EAC, must include at least the following:

> *"3(d) the monitoring program that will be used including methods, location, frequency, timing and duration of the monitoring;*

3(e) the baseline information that will be used, or collected where existing baseline information is insufficient, to support the monitoring program;

3(f) the scope, content and frequency of reporting of the monitoring results;

3(g) the identification of qualitative and quantitative triggers, which, when observed through monitoring required under paragraph d), will require the Holder to alter existing, or develop new, mitigation measures to avoid, reduce, and/or remediate effects;

3(h) methods that will be applied to detect when a numeric trigger, or type or level of change referred to in paragraph g) occurs;

3(i) a description of the process for and timing to alter existing mitigation measures or develop new mitigation measures to reduce or avoid effects;

3(j) identification of the new and/or altered mitigation measures that will be applied when any of the changes identified in paragraphs a) to c) occur, or the process by which those will be established and updated over the relevant timeframe for the specific condition;

3(k) the monitoring program that will be used to determine if the altered or new mitigation measures and/or remediation activities are effectively mitigating or remediating the effects and or avoiding potential effects; and

3(l) The scope, content and frequency of reporting on the implementation of altered or new mitigation measures."

9.1 Air Quality Trigger Response Framework

Triggers are provided for the following action levels of the adaptive management framework: none, and low, medium; and high. The framework is intended to provide an early-warning system such that when defined action levels are triggered there is sufficient time to prevent irreversible adverse environmental effects to health of Indigenous Peoples.

The air quality adaptive management triggers and responses are provided in Table 9.1-1. The actions that will be taken are based on visual inspections of fugitive dust on the MAR and mine site roads, dustfall monitoring, PM, PM_{10}, and $PM_{2.5}$, metals, SO_2 and NO_2 measurements at the operations camp. An appropriate action level will be developed based on guidance in the adaptive management framework: British Columbia Ambient Air Quality Objectives (BC ENV 2020c) for particulate matter and gases such as nitrogen dioxide and sulfur dioxide.

It is important to note that appropriate action responses resulting from dust observations are quite different than appropriate action responses resulting from fine PM measurements. When visible dust is observed, typically the source of the dust will be evident, and the mitigation measures are well-defined as shown in Table 9.1-1.

The PM_{10} and $PM_{2.5}$ concentrations will be measured on 24-hour basis every three days during summer and every six days during winter and there will be a delay between the measurement date and reporting results after weighing the filter for the 24-hour period. Additionally, unlike a visible dust observation, the source of the elevated PM_{10} and $PM_{2.5}$ concentrations may or may not be immediately apparent. Some analysis may be required to determine the cause and specify appropriate corrective action(s). This analysis will involve determining the operational and/or meteorological conditions that were present during the elevated PM event and determining if operational changes should be implemented to limit emissions.

Table 9.1-1: Trigger Action Response

Component	Location	Level	Trigger	Management Response
Fugitive Dust	Unpaved Roads	None	Dust plume less than half the height of a haul truck tire.	No action. Continue work in accordance with site management procedures.
		Low	Dust plume less than half the size of a haul truck for any period of time up to 30 minutes.	Limited watering of high traffic areas. Repeat visual inspection every 2 hours depending on weather.
		Medium	Dust plume same size as a haul truck extending beyond local area for periods longer than half a day.	Continuous watering of high traffic areas until dust plume subsides. Speed limit restrictions in high traffic areas.
		High	Dust plume greater than the size of a haul truck for periods longer than 1 day, or when dust plumes extend beyond the active mine area/infrastructure.	Increase frequency of watering and if not successful examine longer use of alternative dust suppressants (e.g., calcium or magnesium chloride, lignin compounds, environmentally friendly oils or clay additives). Speed limit restrictions may be required if dust cannot be controlled by watering. Closure of certain routes may be required if dust cannot be controlled by watering or speed restrictions.
	Surface Earthworks	None	Minor localized dust (dust plumes that are less than 2 m in height) during construction and normal mine operations.	No action. Continue work in accordance with site management procedures.
		Low	Visible dust plumes rising over 2 m above the active construction area for longer than 30 minutes.	Minimize material movement in areas with active construction or operation and heavy equipment use.
		Medium	Triggers per level 1 but with dust plume extending beyond local area for periods longer than half a day.	Application of water to exposed construction area (if this is a source).
		High	Extensive areas of dust generation with large dust plumes for periods longer than 1 day or when dust plumes extend beyond the active mine area/ infrastructure.	Increase frequency of watering and if not successful apply gravel to exposed construction area (if this is a source). Investigate long term solutions if dust plumes persist.

Component	Location	Level	Trigger	Management Response
Fugitive Dust *(cont'd)*	Stockpiles	None	Minor localized dust (dust plumes that are less than 2 m in height) during construction and normal mine operations.	No action. Continue work in accordance with site management procedures.
		Low	Visible dust plumes rising over 2 m above the ground for longer than 30 minutes.	Turn on spray bar sprinklers[1]. During periods where temperature are below freezing add reagents to control dust.
		Medium	Triggers per level 1 but with dust plume extending beyond local area for periods longer than half a day.	Increase the rate of water application using spray bar sprinklers. During periods where temperature are below freezing, add reagents to control dust.
		High	Extensive areas of dust generation with large dust plumes for periods longer than 1 day or when dust plumes extend beyond the active mine area/infrastructure.	Examine the possibility of re engineering the spray bar sprinklers[1] to provide more effective water coverage of transfer points.
	Material handling transfer locations	None	Minor localized dust (dust plumes that are less than 2 m in height) during construction and normal mine operations.	No action. Continue work in accordance with site management procedures.
		Low	Visible dust plumes rising over 2 m above the ground for longer than 30 minutes.	Turn on spray bar sprinklers[1]. During periods where temperature are below freezing add reagents to control dust.
		Medium	Triggers per level 1 but with dust plume extending beyond local area for periods longer than half a day.	Increase the rate of water application using spray bar sprinklers[1]. During periods where temperature are below freezing, add reagents to control dust.
		High	Extensive areas of dust generation with large dust plumes for periods longer than 1 day or when dust plumes extend beyond the active mine area/ infrastructure.	Examine the possibility of re engineering the spray bar sprinklers[1] to provide more effective water coverage of transfer points.

Component	Location	Level	Trigger	Management Response
PM_{10} and $PM_{2.5}$	Operations Camp	None	The annual average PM_{10} and $PM_{2.5}$ concentration is less than or equal to 50% of the Ambient Air Quality Objective.	No action. Continue monitoring.
		Low	The annual average PM_{10} and $PM_{2.5}$ concentration is greater than 50% but less than or equal to 80% of the Ambient Air Quality Objective.	Continue monitoring. Develop causal analysis and associated mitigations in addition to a schedule for implementation based on the exceedance level.
		Medium	The annual average PM_{10} and $PM_{2.5}$ concentration is greater than 80% but less than or equal to 100% of the Ambient Air Quality Objective.	Develop causal analysis and associated mitigations in addition to a schedule for implementation. Increase sampling frequency to every other day.
		High	The annual average PM10 and $PM_{2.5}$ concentration is greater than the Ambient Air Quality Objective.	Implement mitigations developed at the medium action level. Increase sampling frequency to daily.
SO_2 and NO_2	Operations Camp	None	The annual average SO_2 and/or NO_2 concentration is less than or equal to 50% of the Ambient Air Quality Objective.	No action. Continue monitoring.
		Low	The annual average SO_2 and/or NO_2 concentration is greater than 50% but less than or equal to 80% of the Ambient Air Quality Objective.	Continue monitoring. Develop causal analysis and associated mitigations in addition to a schedule for implementation based on the exceedance level.
		Medium	The annual average SO_2 and/or NO_2 concentration is greater than 80% but less than or equal to 100% of the Ambient Air Quality Objective.	Develop causal analysis and associated mitigations in addition to a schedule for implementation.
		High	The annual average SO_2 and/or NO_2 concentration is greater than the Ambient Air Quality Objective.	Implement mitigations developed at the medium action level.

Note:

[1] Spray bar sprinklers will be installed once trialing is complete.

For these reasons, the action/response associated with each level of alert is expressed in terms of how quickly the analysis and response is to be carried out. It is possible that fugitive dust will contribute to PM_{10}/ $PM_{2.5}$ concentrations, and thus actions taken in response to visual observations may be part of the response for elevated PM_{10}/ $PM_{2.5}$. The actions/responses for PM_{10}/ $PM_{2.5}$ listed in Table 9.1-1 are triggered based on 24-hour measurements since annual averages will only be known on an annual basis. As part of the adaptive management process the frequency of elevated 24-hour PM_{10}/ $PM_{2.5}$ concentrations and the trend analyses of PM_{10}/ $PM_{2.5}$ concentrations will be tracked and evaluated to provide assurance that the standards and objectives are achieved.

The EM or a qualified person will be responsible for calculating the 3-month trend analyses $PM_{2.5}$ concentration and will evaluate the frequency of occurrence of elevated 24-hour PM_{10} and $PM_{2.5}$ concentrations. Based on the findings, the EM may propose modifications to emissions control equipment and/or to dust management and amend the AQDMP. In addition, the EM will compare measurements to predictions from the effects assessment and make recommendations regarding modifications to mitigation measures if warranted.

If there is an air quality advisory issued by ENV that affects the region where the mine is located, the EM will determine if an adjustment to a higher alert level described in Table 9.1-1 is required to further mitigate dust emissions.

Passive sampling for SO_2 and NO_2 and low-flow particulate sampling with Partisols or similar units to monitor fine particulates at Tatelkuz Lake Resort and Tatelkus Lake 28 will be established to monitor air quality impacts offsite in the case that air quality monitoring on-site indicates it is required.

9.2 Follow-up Program

A Follow-up Program (FUP) will be conducted through all phases of the Project as defined by the federal DS Condition 6.12. The FUP has been developed and will continue to be updated in consultation with Indigenous groups (see Sections 8.4, 10.1.2, and 11). The main objective of the FUP will be to compare results of the air quality monitoring program with predictions made in the Environmental Assessment and determine the effectiveness of mitigation measures. Monitoring components will include NO_2, SO_2, $PM_{2.5}$, PM_{10}, dust, and CO.

To determine if modified or additional mitigation measures are required the results of the monitoring program will be compared to the predicted concentrations of criteria air contaminants shown in Tables 7.2-1 and 7.2-2. The predicted concentrations are considered to be baseline concentrations for the purposes of the FUP. None of the baseline concentrations reported in Tables 7.2-1 and 7.2-2 exceeded ambient air quality standards.

If the monitoring program as described in Section 8.3 exceeds the criteria air contaminant standards provided in Table 7.1-1 then additional mitigation measures including contingency measures described in Table 8.2-1 will be considered and implemented where required. The final determination of which additional mitigation will be required will be based on an analysis of the causes of the exceedances. The FUP will, over time, inform the monitoring program and adaptive management to improve mitigations, and result in closer tracking of predicted results with monitored results:

- Low = exceed baseline – continue monitoring
- Medium = exceed baseline and predicted – continue monitoring, develop casual analysis (if observed concentrations are approaching the guidelines)
- High = exceed baseline, predicted, and guideline – implement mitigations plan, increase sampling frequency, etc.

The FUP will be conducted on an annual basis as part of the annual reporting as described in Section 11.

10.0 Reporting and Record Keeping

10.1 Reporting

10.1.1 *Environmental Management Act* Annual Reporting

Environmental Management Act Permit #110650 requires annual reports to be prepared by a qualified professional and be submitted to ENV. Annual reports are public documents and include a summary of environmental incidents and complaints, all monitoring under permits, an assessment of the data, and recommendations as appropriate. The reporting must also conform to the requirements outlined in Developing a Fugitive Dust Management Plan for Industrial Projects (BC EMMPR & ENV, 2018) which require that adaptive management be used to evaluate the effectiveness and direct continual improvement of the AQFDMP.

BW Gold will follow reporting requirements in Technical Guidance 4 (BC MOE 2016b) and any amendments or updates thereto. Permit #110650 annual reporting must be submitted by March 31 of each year.

10.1.2 Decision Statement Annual Reporting

Annual reporting and information sharing requirements in the federal DS applicable to this plan are identified below. Conditions 2.11, 2.12, 2.13 and 2.14 identify annual reporting and information sharing requirements as follows:

- Condition 2.11 requires “The proponent [BW Gold] shall, commencing in the reporting year during which the proponent begins the implementation of the conditions set out in the DS, prepare an annual report that describes the activities undertaken by the proponent [BW Gold] in the reporting year to comply with each condition in the DS” as well as other matters identified in the Condition.
- Condition 2.12 requires “The proponent [BW Gold] shall provide a draft annual report in condition 11 to Indigenous groups, no later than June 30 following the reporting year to which the annual report applies. BW Gold shall consult the Indigenous groups on the content and findings in the draft annual report”.
- Condition 2.13 requires “The proponent [BW Gold] in consideration of any comments received from Indigenous groups pursuant to condition 2.12, shall revise and submit to the Agency [Impact Assessment Agency of Canada] and Indigenous groups a final annual report, including an executive summary in both official languages, no later than September 30 following the reporting year to which the annual report applies”.
- Conditions 2.14 requires:
  - “The Proponent [BW Gold] shall publish on the Internet, or any medium which is publicly available, the annual reports and the executive summaries…”. Names and contact information will be removed from the annual reports to protect confidentiality.
  - “The Proponent [BW Gold] shall keep these documents publicly available for 25 years following the decommissioning of the Designated Project”.
  - “The Proponent [BW Gold] shall notify the Agency and Indigenous groups of the availability of these documents within 48 hours of their publication”.

In addition, the DS Condition 6.15 requires that a plan to communicate the results of the FUP (Section 9.2) in plain language to Indigenous Groups and the relevant authorities as discussed in Section 10. This will be satisfied through the Annual Report.

10.1.3 Environmental Assessment Certificate #M19-01 Annual Reporting

Condition 5 of the EAC sets out reporting requirements. BW Gold will submit a report to the attention of the Environmental Assessment Office and Aboriginal Groups on the status of compliance with EAC #M19--01 at the following times:

a. at least 30 days prior to the start of Construction;

b. on or before March 31 in each year after the start of Construction;

c. at least 30 days prior to the start of Operations;

d. on or before March 31 in each year after the start of Operations;

e. at least 30 days prior to the start of Closure;

f. on or before March 31 in each year after the start of Closure until the end of Closure;

g. at least 30 days prior to the start of Post-Closure; and

h. on or before March 31 in each year after the start of Post-Closure until the end of Post-Closure.

10.2 Emergency Reporting and Process Modification Procedures

In the event of an emergency or other condition which prevents normal operation of the air pollution control systems described in Section 5.3 or leads to an unauthorized discharge, BW Gold will take action to immediately to restore the normal operation and to prevent any unauthorized discharges. The emergency or other condition along with the remedial action that has and will be taken will be reported to the EnvironmentalCompliance@gov.bc.ca email address or as otherwise instructed by ENV.

In the event of a spill or the risk of a spill occurs, BW Gold will report it immediately by calling 1-800-663-3456 in accordance with the Spill Reporting Regulation.

In the case that BW Gold would like to modify a process that may increase the generation of fugitive dust and/or adversely affect the quality and/or quantity of the discharge to the receiving environment, ENV will be notified before implementing changes to any process. The notification must include details of any mitigation measures to be implemented as a result of the process modification. In addition BW Gold will request written approval should there be a need to bypass processes authorized by ENV.

10.3 Record Keeping

The EM will be responsible for ensuring dust events are logged, including details of the on-site activities, meteorological conditions, and the management actions taken. The EM will also be responsible for ensuring that analysis and mitigation for any fine PM event is completed in a timely manner. Records will be maintained for:

- Public complaints;
- Meteorological stations;
- Dust visual observations;
- Particulate matter monitoring; and
- Nitrogen dioxide and SO_2 monitoring.

Monitoring data will be entered into an electronic database and have quality control checks completed upon receipt of results. Data will be entered into a standard format that allows for data reporting and analyses. Data and data comparisons will be stored in a single file format for each type of survey or monitoring activity. Monitoring records will be maintained and retained in accordance with Conditions 12.1 and 12.2 of the federal DS respectively. The records will be made available upon request.

11.0 Plan Revisions

The AQDMP will be reviewed annually by a qualified professional per ELoMC annual schedule to: review the monitoring program; confirm that the measures in the plan are being implemented; and identify any improvements to improve the effectiveness of fugitive dust best management practices. AQDMP revisions will be required:

- If the monitoring program shows that the effects of the Project are not mitigated to the extent contemplated or predicted in the Application/EIS (New Gold 2015) or exceed adaptive management triggers;
- There are new and /or changes to emission sources; and
- There are changes to other relevant management plans and regulatory requirements; and
- There are amendments to the operating permit conditions.

Proposed changes will be documented via the provision a change log document including rationale for changes, which will be provided at the same time (where possible) or following resubmission of the AQFDMP. As required by EAC #M19-01 Condition 20, the plan and any amendments thereto, will be implemented to the satisfaction of a qualified professional throughout construction, operations, and closure and to the satisfaction of the EAO. Revised versions of the AQDMP will be provided to EAO, ELoMC, and Northern Health through the Condition 42 public website. Upon submissions of updated Management plans, reviewers will be invited to share and direct any comments, questions or concerns on the AQFDMP updates through the ELoMC. Regular presentations of implementation of management plans including the AQFDMP will also be provided to reviewers per the ELoMC annual schedule of topics/development of monthly meeting agendas.

12.0 Qualified Professionals

This management plan has been prepared and reviewed by the following qualified professionals:

Appendix A Concordance with Environmental Assessment Certificate #M19-01 (June 21, 2019)

Appendix A Concordance with Environmental Assessment Certificate #M19-01 (June 21, 2019)

Condition #	Description	Action/Location in the Plan
1.	**Document Review and Implementation** Where a condition of this Certificate requires the Holder to provide a plan, program or other document, the Holder must provide the plan, program or other document to the EAO and Aboriginal Groups in the timeframe referenced in such condition, unless otherwise approved by the EAO. The EAO may, within 60 days of receiving a copy of such plan, program or other document, advise that: 1. the Holder may proceed to implement the plan, program or other document with or without revisions; or 2. a revised plan, program, or other document must be provided for approval of the EAO prior to a specified activity or milestone. If the EAO advises pursuant to paragraphs (a) or (b) that changes are required to a plan, program, or other document, then the Holder must follow the instructions of the EAO in that regard. If the EAO does not advise on paragraphs (a) or (b) within 60 days of the EAO receiving a plan, program, or other document, the Holder may proceed to implement the plan, program or other document. The Holder may, or the EAO may require the Holder to, revise any plan, program or other document if the Holder or the EAO determines that the implementation of the plan, program or other document is not: 3. meeting one or more objectives of the plan, program or other document set out in the relevant condition of this Certificate; 4. having the effects contemplated or intended, as set out in the plan, program or other document itself; 5. consistent with the Certificate; or 6. consistent with changes in industry best practices or technology.	Draft AQDMP provided to Aboriginal Groups in August 2021 for review and comment.
2.	**Plan Development** Where a condition of this Certificate requires the Holder to develop a plan, program or other document, any such plan, program or other document must, at a minimum, include the following information:	
	a. purpose and objectives of the plan, program or other document;	Section 1
	b. roles and responsibilities of the Holder and Employees;	Section 3, Table 3-1

Condition #	Description	Action/Location in the Plan
	c. names and, if applicable, professional certifications and professional stamps/seals, of those responsible for the preparation of the plan, program, or other document;	Signed by qualified professional
	d. schedule for implementing the plan, program or other document throughout the relevant Project phases;	Section 1 – the AQDMP will be implemented during construction, operations and closure
	e. means by which the effectiveness of the mitigation measures will be evaluated including the schedule for evaluating effectiveness;	Section 8.3, Section 9.2
	f. schedules and methods for the submission of reporting to specific agencies, Aboriginal Groups and the public and the required form and content of those reports; and	Section 10
	g. process and timing for updating and revising the plan, program or other document, including any consultation with agencies and Aboriginal Groups that would occur in connection with such updates and revisions.	Section 11
3.	**Adaptive Management** Where a condition of this Certificate requires the Holder to develop a plan, program or other document that includes monitoring, including monitoring of mitigation measures or monitoring to determine the effectiveness of the mitigation measures, the Holder must include adaptive management in that plan. The objective of the adaptive management is to address the circumstances that will require the Holder to implement alternate or additional mitigation measures to address effects of the Project if the monitoring shows that those effects: a. are not mitigated to the extent contemplated in the Application; b. are not predicted in the Application; or c. have exceeded the triggers identified in paragraph g) of this condition. The adaptive management in the plan must include at least the following: d. the monitoring program that will be used including methods, location, frequency, timing and duration of the monitoring;	Section 4, Section 8
	e. the baseline information that will be used, or collected where existing baseline information is insufficient, to support the monitoring program;	n/a (the baseline information is sufficient and monitoring data will continue to be collected over the LoM)
	f. the scope, content and frequency of reporting of the monitoring results;	Section 10.1

Condition #	Description	Action/Location in the Plan
	g. the identification of qualitative and quantitative triggers, which, when observed through monitoring required under paragraph d), will require the Holder to alter existing, or develop new, mitigation measures to avoid, reduce, and/or remediate effects;	Section 9.1, Table 9.1-1
	h. the methods that will be applied to detect when a numeric trigger, or type or level of change referred to in paragraph g), has occurred.	Section 9.1, Table 9.1-1
	i. a description of the process for and timing to alter existing mitigation measures or develop new mitigation measures to reduce or avoid effects;	Section 9.2
	j. identification of the new and/or altered mitigation measures that will be applied when any of the changes identified in paragraphs a) to c) occur, or the process by which those will be established and updated over the relevant timeframe for the specific condition;	Identification of new or altered mitigation measures will be determined based on monitoring results.
	k. the monitoring program that will be used to determine if the altered or new mitigation measures and/or remediation activities are effectively mitigating or remediating the effects and or avoiding potential effects; and,	Monitoring results and will be used to determine if mitigation measures are effective or need to be modified. The monitoring program is described in Section 8.3.
	l. the scope, content and frequency of reporting on the implementation of altered or new mitigation measures.	Section 10.1
	If there are any requirements or mitigation measures required in the plan, program or other document for which adaptive management, or elements of adaptive management listed in paragraphs d) to l) are assessed to be not appropriate or applicable, the plan must include identification of those requirements and measures, and the rationale for that assessment.	This will be assessed in future plan updates.
4.	**Consultation** Where a condition of this Certificate requires the Holder consult a particular party or parties regarding the content of a plan, program or other document, the Holder must, to the satisfaction of the EAO: 1. provide written notice to each such party that: i) includes a copy of the plan, program or other document; ii) invites the party to provide its views on the content of such plan, program or other document; and iii) indicates: 1.1 if a timeframe for providing such views to the Holder is specified in the relevant condition of this Certificate, that the party may provide such views to the Holder within such time frame; or	Draft AQDMP provided to Aboriginal Groups in August 2021 for review and comment. While BW Gold sets general timeframes for review and comments via written notice, BW Gold and Aboriginal Groups engage in ongoing communication to establish flexible timeframes agreed to by all parties.

Condition #	Description	Action/Location in the Plan
	1.2 if a timeframe for providing such views to the Holder is not specified in the relevant condition of this Certificate, specifies a reasonable period during which the party may submit such views to the Holder;	
	2. undertake a full and impartial consideration of any views and other information provided by a party in accordance with the timelines specified in a notice given pursuant to paragraph (a);	Comments from Aboriginal Groups and corresponding BW Gold responses are maintained in a tracking table. BW Gold comprehensively and impartially reviews received comments received within agreed upon timeframes on a regular basis.
	3. provide a written explanation to each such party that provided comments in accordance with a notice given pursuant to paragraph (a) as to: 3.1 how the views and information provided by such party to the Holder have been considered and addressed in a revised version of the plan, program or other document; or 3.2 why such views and information have not been addressed in a revised version of the plan, program or other document;	Responses BW Gold provides in the tracking table include explanations on how comments from Aboriginal Groups have been addressed in a revised version of the AQMP. In cases where such comments have not been addressed in the revised version, BW Gold similarly explains its rationale for doing so.
	4. maintain a record of consultation with each such party regarding the plan, program or other document; and	BW Gold is maintaining consultation records
	5. provide a copy of such consultation record to the EAO, the relevant party, or both, promptly upon the written request of the EAO or such party. The copy of such consultation record must be provided to the EAO, relevant party, or both, no later than 15 days after the Holder receives the request for a copy of the consultation record, unless otherwise authorized by the EAO.	Potential future requirement.
20.	The Holder must retain a Qualified Professional to develop an Air Quality and Dust Management Plan. The plan must be developed in consultation with ENV, EMPR, NHA and Aboriginal Groups. The plan must include at least the following: a. the means by which the mitigation measures identified in the Mitigations Table required under Condition 43 for the valued component Air Quality will be implemented;	Section 8.2

Condition #	Description	Action/Location in the Plan
	b. the means by which guidance contained in EMPR's and ENV's guidance: Developing a Fugitive Dust Management Plan for Industrial Projects (May 2018, or as updated or replaced from time to time) is addressed;	Appendix C
	c. the identification and detailed descriptions of dust-emitting sources from the Project;	Section 6
	d. the identification of environmental receptors to be monitored;	Section 8.3
	e. a compliance monitoring program, including the locations of monitoring stations and equipment that will be used to conduct the monitoring;	Section 8.3
	f. the contaminants of potential concern (COPC) and corresponding concentrations (triggers) that would cause the Holder to take corrective action to reduce contaminant concentrations to avoid adverse health effects to receptors identified in paragraph d);	Section 7.1
	g. how this plan will inform the Wildlife Management and Monitoring Plan (Condition 23), and Country Foods Monitoring Plan (Condition 41); and	Section 1.4
	h. how the Holder will notify the EAO, ENV, EMPR, NHA, Aboriginal Groups, IEM, and the public in the event that contaminant concentration triggers identified in paragraph f) are exceeded. The notification must include both a technical report and a plain language summary of the technical report.	Section 8.4
	The Holder must provide the draft plan that was developed in consultation with ENV, EMPR, NHA, and Aboriginal Groups to ENV, EMPR, NHA, Aboriginal Groups and the EAO for review a minimum of 60 days prior to the planned commencement of Construction or as listed in the Document Submission Plan required by Condition 10 of this Certificate.	To be submitted 60 days prior to planned commencement.
	The plan and any amendments thereto, must be implemented to the satisfaction of a Qualified Professional throughout Construction, Operations, and Closure and to the satisfaction of the EAO.	Future requirement.

Appendix B Concordance with Canadian Environmental Assessment Agency Decision Statement (April 2019)

Appendix B Concordance with Canadian Environmental Assessment Agency Decision Statement (April 2019)

Condition #	Description	Location in Plan
2.1 (General Conditions)	The Proponent shall ensure that its actions in meeting the conditions set out in this Decision Statement during all phases of the Designated Project are considered in a careful and precautionary manner, promote sustainable development, are informed by the best information and knowledge available at the time the Proponent takes action (including community and Indigenous traditional knowledge), are based on methods and models that are recognized by standard-setting bodies, are undertaken by qualified individuals, and have applied the best available economically and technically feasible technologies.	Section 5; Section 7; Section 8; Section 12
2.2 (General Conditions)	The Proponent shall, when mitigation is a requirement of a condition set out in this Decision Statement, give preference to avoiding the adverse environmental effect of the Designated Project over minimizing the adverse environmental effect of the Designated Project. If unable to avoid the adverse environmental effect, the Proponent shall give preference to minimizing the adverse environmental effect of the Designated Project over compensating for the adverse environmental effect of the Designated Project. If unable to minimize the adverse environmental effect, the Proponent shall compensate for the adverse environmental effect of the Designated Project.	Section 8.2; Section 8.3
2.3 (General Conditions)	The Proponent shall, where consultation is a requirement of a condition set out in this Decision Statement: 2.3.1 provide a written notice of the opportunity for the party or parties being consulted to present their views and information on the subject of the consultation; 2.3.2 provide all information available and relevant on the scope and the subject matter of the consultation and a period of time agreed upon with the party or parties being consulted, not less than 15 days, to prepare their views and information; 2.3.3 undertake a full and impartial consideration of all views and information presented by the party or parties being consulted on the subject matter of the consultation; 2.3.4 strive to reach consensus with Indigenous groups; and 2.3.5 advise the party or parties being consulted on how the views and information received have been considered by the Proponent including a rationale for why the views have, or have not, been integrated. The Proponent shall advise the party or parties in a time period that does not exceed the period of time taken in 2.3.2.	In Progress; Section 11

Condition #	Description	Location in Plan
2.4 (Consultation)	The Proponent shall, where consultation with Indigenous groups is a requirement of a condition set out in this Decision Statement, determine and strive to reach consensus with each Indigenous group regarding the manner by which to satisfy the consultation requirements referred to in condition 2.3, including: 2.4.1 the methods of notification; 2.4.2 the type of information and the period of time to be provided when seeking input; 2.4.3 the process to be used by the Proponent to undertake impartial consideration of all views and information presented on the subject of the consultation; and 2.4.4 the period of time and the means by which to advise Indigenous groups of how their views and information were considered by the Proponent.	In Progress
2.11 (Annual Reporting)	The Proponent shall, commencing in the reporting year during which the Proponent begins the implementation of the conditions set out in this Decision Statement, prepare an annual report that sets out: 2.11.1 the activities undertaken by the Proponent in the reporting year to comply with each of the conditions set out in this Decision Statement; 2.11.2 how the Proponent complied with condition 2.1; 2.11.3 for conditions set out in this Decision Statement for which consultation is a requirement, how the Proponent considered any views and information that the Proponent received during or as a result of the consultation, including a rationale for how the views have, or have not, been integrated; 2.11.4 the information referred to in conditions 2.5 and 2.6 for each follow-up program; 2.11.5 the results of the follow-up program requirements identified in conditions 3.14, 3.15, 3.16, 4.5, 5.5, 6.11, 6.12, 6.13, 6.14, 8.18.6, 8.20.5, 8.21, and 8.22 if required; 2.11.4 any update made to any follow-up program in the reporting year; 2.11.7 any modified or additional mitigation measures implemented or proposed to be implemented by the Proponent, as determined under condition 2.9 and rationale for why mitigation measures were selected pursuant to condition 2.5.4; and 2.11.8 any change(s) to the Designated Project in the reporting year.	Section 10.1.2
2.12 (Annual Reporting)	The Proponent shall provide a draft annual report referred to in condition 2.11 to Indigenous groups, no later than June 30 following the reporting year to which the annual report applies. The Proponent shall consult Indigenous groups on the content and findings in the draft annual report.	Section 10.1.2
2.13 (Annual Reporting)	The Proponent, in consideration of any comments received from Indigenous groups pursuant to condition, 2.12 shall revise and submit to the Agency and Indigenous groups a final annual report, including an executive summary in both official languages, no later than September 30 following the reporting year to which the annual report applies.	Section 10.1.2

Condition #	Description	Location in Plan
2.15 (Information Sharing)	When the development of any plan is a requirement of a condition set out in this Decision Statement, the Proponent shall submit the plan to the Agency and to Indigenous groups prior to construction, unless otherwise required through the condition.	In Progress
6.1	The Proponent shall mitigate, during all phases of the Designated Project, emissions of fugitive dust from the Designated Project, including dust associated with vehicles on project roads.	Section 8.2, Table 8.2-1
6.3	The Proponent shall develop, prior to construction and in consultation with Indigenous groups, a protocol for receiving complaints related to the exposure to noise and dust from the Designated Project. The Proponent shall respond to any noise or dust complaint(s) within 48 hours of the complaint being received and shall implement corrective actions to reduce exposure to noise or dust in a timely manner. The Proponent shall implement the protocol during construction, operation and decommissioning.	Section 8.4
6.12	The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, a follow-up program to verify the accuracy of the environmental assessment as it pertains to adverse environmental effects of the Designated Project on the health of Indigenous Peoples as a result of changes to air quality and determine the effectiveness of mitigation measures. As part of the implementation of the follow-up program, the Proponent shall monitor nitrogen dioxide (NO_2), sulfur dioxide (SO_2), fine particulate matter ($PM_{2.5}$), particulate matter (PM_{10}), dust, and carbon monoxide (CO) in air. The Proponent shall implement the follow-up program during all phases of the Designated Project and shall apply conditions 2.9 and 2.10 when implementing the follow-up program.	Section 9
6.15	The Proponent shall develop, prior to construction and in consultation with Indigenous groups and relevant authorities, and implement, during all phases of the Designated Project, a plan to communicate the results of the follow-up program referred to in conditions 6.11, 6.12, 6.13 and 6.14 in plain language to Indigenous groups and relevant authorities. The communication plan shall include the procedures to communicate, including the frequency of communication.	Section 10.1.2

Appendix C Concordance Table with Developing a Fugitive Dust Management Plan for Industrial Projects (EMPR & ENV 2018)

Appendix C Concordance Table with Developing a Fugitive Dust Management Plan for Industrial Projects (EMPR & ENV 2018)

Section	Description	Location in the Plan
1. Introduction	This section provides contextual background information on the project, project overview, and regulatory framework.	Section 1 Section 2
1.1 Company Information	Provide an overview including the name, organization and structure of the operating company.	Section 1.1
1.2 Permitting	Identify the permit for which this document is being developed and other relevant licences, authorizations and regulations which impact on this document.	Section 1
1.3 Purpose/Objectives and Scope	Describe the purpose and/or objectives that this plan will address.	Section 1
1.4 Authorship	A record of the development of the FDMP should be included.	Section 12
1.5 Submitted to	A record of the development and submission of the FDMP should be included.	n/a – The plan is being submitted with a Joint *Mines Act/ Environmental Management Act* permit application. This application seeks authorizations for air discharges.
2. Roles and Responsibilities	Describe the roles and responsibilities for implementation of, and compliance with, the plan.	Section 3 (AQDMP)
3. Facility Description and Setting		
3.1 Site Ownership and Physical Location	Provide information on the site ownership, all relevant tenures/ permit boundaries, and the project location in relation to local communities and other sensitive receptors.	Section 5.1 and 5.2
3.2 Descriptive Overview of the Facility	Provide a brief overview of the site and activities that could result in fugitive dust.	Section 5.3
3.3 Process Flow Diagram or Description of the Facility	Provide a process flow diagram and/or use descriptions to indicate the process, operations and equipment that have the potential to emit fugitive dust.	Figure 5.3-3
3.4 Facility Site Map (Including Dust Sources)	The site map will clearly identify the locations of all fugitive dust emission sources and site features discussed in the facility description.	Figure 5.2-3

Section	Description	Location in the Plan
4. Identification of Potential Sources or Activities which Generate Fugitive Dust	The FDMP must contain a list of potential sources and/or activities which may generate fugitive dust.	Section 6
4.1 Source List Review	The FDMP must include a procedure to ensure the source list is reviewed on a regular schedule to reflect current conditions.	Section 11
4.2 Source List Update Procedure	Outline the procedure to take when updating or removing existing sources or adding new sources to the list established in Section 4.1	Section 11
4.3 Fugitive Dust Source List	The fugitive dust source list must include the following: • unique identification number or designation for each source; • location of the source within the facility (or reference id on the included site map); • potential source of fugitive dust; • factors influencing generation of dust (e.g., wind, operational activities); and • identification of the dust-generating material (e.g., aggregate, clean coal, road dust).	Table 6-2
5. Identification of Potential Effects of Fugitive Dust	The potential effects of dust both on and off the site should be identified.	Section 7
6. Fugitive Dust Management	The FDMP must contain a description of how fugitive dust will be managed onsite.	Section 8.2
6.1 Best Management Practices (BMP)	BMPs represent the current ‘state of practice’ approach to manage dust impacts and effects, and aim to produce outcomes consistent with social, economic and environmental expectations.	Table 8.2-1
6.2 Site Specific Mitigation Measures	The FDMP is most effective when it is developed to be a site-specific, operational plan.	Section 8.2
7. Plan Implementation		
7.1 Training	The plan should identify training and frequency of training of site personnel identified in the ‘Roles and Responsibilities’ section to ensure that they are aware of their responsibilities under the plan.	Section 8.1
7.2 Monitoring and Maintenance	Monitoring activities may include tracking of public complaints, visual inspection of facilities by site personnel, and quantitative monitoring of the environment, such as passive particulate deposition (dustfall) or active suspended particulate (TSP, PM10 or PM2.5) sampling on and off site, to evaluate the effectiveness of dust control practices and to quantify levels of fugitive dust and its composition leaving the site.	Section 8.3

Section	Description	Location in the Plan
7.3 Trigger Action Response Plan (TARP)	The Response Plan should include specific triggers, actions to be taken, and reporting protocols.	Section 9
7.4 Record Keeping	The FDMP must include information on record keeping, including a complaint tracking tool and a record of dust events and responses.	Section 10.2
8. Adaptive Management	Adaptive management may be used to evaluate the effectiveness and direct continual improvement of the FDMP.	Section 9
9. Reporting	Outline the structure and timing of reporting, taking into account the annual reporting requirements of regulatory agencies, updates to First Nations and the public, and reporting related to the TARP (i.e., reporting out on dust events).	Section 10.1
10. References	References	Section 13.0

Context Statement

The Blackwater Gold Project (Project) received an Environmental Assessment Certificate #M19-01 (EAC) on June 21, 2019, under the 2002 *Environmental Assessment Act,* and received a Decision Statement (DS) on April 15, 2019, under the *Canadian Environmental Assessment Act, 2012*, approving the Project with conditions. Blackwater is an open pit gold and silver mine with associated ore processing facilities located 110 km southwest of Vanderhoof in central British Columbia. The EAC and DS includes activities associated with the construction and operation of an electrical transmission line (TL) that is required to provide the energy requirements for the Project. A number of provincial permits and authorizations will be required to construct and operate the TL. The primary permits include the following: Statutory Right-of-Way (StROW) and interim Licence of Occupation (LOO) for Crown Land, an Occupant Licence to Cut (OLTC), Road and Special Use Permits (for Roads), and Junction Permits for critical road intersections.

This Transmission Line Air Quality and Fugitive Dust Management Plan (TL AQDMP) supports applications for Crown land tenure (i.e., ROW, LOO) under the Land Act and is also required under the *Forest and Range Practices Act* (FRPA), and the Occupational Health and Safety (OHS) Regulation.

1.0 Project Overview

The Blackwater Gold Project (the Project) is a gold and silver open pit mine located in central British Columbia (BC), approximately 112 kilometres (km) southwest of Vanderhoof, 160 km southwest of Prince George, and 446 km northeast of Vancouver. The Project site is presently accessed via the Kluskus Forest Service Road (FSR), the Kluskus-Ootsa FSR and an exploration access road, which connects to the Kluskus-Ootsa FSR at km 142. Electrical power for the Project will be supplied by a new approximately 135 km, 230 kilovolt overland transmission line (TL) that will connect to the BC Hydro grid at the Glenannan substation located near the Endako mine, 65 km west of Vanderhoof. A brief description of the proposed TL is as follows:

- From the Glenannan substation to the mine site permit area, the transmission line will be permitted by way of Licence of Occupation (statutory right-of-way; ROW);
- The TL will be constructed within a cleared right of way (ROW) of 40 metre (m) width for standard spans, but up to 50 m width for longer spans in select areas. The TL ROW area is approximately 515 ha;
- Existing permitted and non-status roads will be used for the purpose of accessing the ROW. New access trails and stream crossings will be located only within the TL cleared ROW;
- Equipment and material laydown areas will also lie within the cleared ROW; and
- The construction workforce will be housed at the Project camp or other independent commercial accommodations in the area.

Overall Project construction is anticipated to take two years. The TL is anticipated to take approximately 14 months to construct.

Post-construction, most of the temporary access trails used for construction on the TL ROW will be deactivated and/or decommissioned within 3 years with the exception of those required for maintenance. During operation of the TL there will be periodic inspections and maintenance as well as occasional unscheduled power supply interruptions that will require inspection and maintenance/repair activities.

Once commissioned, the TL will be required to support mine development throughout the Project's 23-year mine life. There may be some ongoing requirements for the TL following mine closure and into post-closure, pending post-closure electrical load evaluation. The TL will be decommissioned 46 years (or more) after construction, during the Project's post-closure phase.

The Blackwater mine site is located within the traditional territories of Lhoosk'uz Dené Nation (LDN), Ulkatcho First Nation (UFN), Skin Tyee Nation and Tsilhqot'in Nation. The Kluskus and Kluskus-Ootsa Forest Service Roads (FSR) and Project TL cross the traditional territories of Nadleh Whut'en First Nation (NWFN), Saik'uz First Nation (SFN), and Stellat'en First Nation (StFN; collectively, the Carrier Sekani First Nations) as well as the traditional territories of the Nazko First Nation (NFN), Nee Tahi Buhn Band, Cheslatta Carrier Nation and Yekooche First Nation (EAO 2019a and 2019b).

Additional details on transmission line components and activities are presented in Section 3.2 of the Transmission Line Initial Project Description (TL IPD; BW Gold 2022).

1.1 Permitting

A number of provincial permits and authorizations will be required to construct and operate the TL. The primary permits include the following: Statutory Right-of-Way (ROW) and interim Licence of Occupation (LOO) for Crown Land, an Occupancy Licence to Cut (OLTC), Road and Special Use Permits (for Roads) Road Use Permits, and Junction Permits for critical road intersections. This management plan is provided in support of the LOO permit application.

Parameters selected for the TL AQDMP includes some of the same parameters included in the mining assessment:

- Fugitive dust including Total Suspended Particulates (TSP), particulate matter $(PM)_{10}$, fine particulate matter ($PM_{2.5}$); and
- Criteria air contaminants including sulphur dioxide (SO_2) nitrogen dioxide (NO_X) and carbon monoxide (CO).

Federal and provincial legislation that may be relevant to air quality and dust control include:

- *Canadian Environmental Protection Act, 1999*;
- *Forest & Range Practices Act;*
- Environmental Emergency Regulations;
- *Transportation of Dangerous Goods Act;*
- Transportation of Dangerous Goods Regulations;
- *Environmental Management Act 2003;*
- Environmental Code of Practice for Metal Mines 2009;
- *Hazardous Products Act* and Hazardous Products Regulations;
- *Hazardous Materials Information Review Act*;
- *Mines Act;*
- Health, Safety and Reclamation Code for Mines in British Columbia (2021);
- Chief Inspector's Directive – Hydrocarbon Spills, May 15, 2015;
- Workplace Hazardous Materials Information System (WHMIS) Regulation (Mines); and
- Environmental Code of Practice for Aboveground Storage Tank Systems Containing Petroleum Products.

The TL AQDMP and any amendments thereto, must be implemented to the satisfaction of a QP throughout Construction, Operations, and Closure and to the satisfaction of the EAO. Guidance documents related to air quality and fugitive dust management include:

- The Guideline for the Selection of Valued Components and Assessment of Potential Effects (BC EAO, 2013);
- British Columbia Ambient Air Quality Objectives (2021);
- Canadian Ambient Air Quality Standards (2020);
- *Developing a Fugitive Dust Management Plan for Industrial Projects* (May 2018);
- Implementation Guidelines for the Environmental Emergency Regulations (2011);

- On-Road Vehicle and Engine Emission Regulations (SOR/2003-2), Canada Gazette Part II, Vol. 137, No. 1;
- Off-Road Compression-Ignition Engine Emission Regulations (SOR/2005-32);
- US EPA; 40 CFR Part 9, 86 and 89 Control of Emissions of Air Pollution from Non-road Diesel Engines; Final Rule;
- Heavy-duty Vehicle and Engine Greenhouse Gas Emission Regulations (SOR/2013-24);
- British Columbia Field Sampling Manual: 2020 – Part B Air and Air Emissions Testing; and
- BC MOE 2016. Water and Air Baseline Monitoring Guidance Document for Mine Proponents and Operators.

Consistent with the Guidance (EMPR & ENV, 2018), the TL AQDMP does not address occupational health and safety requirements pertaining to workplace exposures to dust. Worker health and safety at Project sites is regulated by the Health, Safety and Reclamation Code for Mines in BC (EMLI, 2021).

1.2 Purpose and Objectives

The purpose of the TL AQDMP is to minimize the effects of the TL project's air emissions on human health and the natural environment. The TL AQDMP has adopted an air quality and emissions management system that recognizes and responds to the issue of gaseous and particulate emissions at all stages of the TL project, from planning, construction, operations, and to closure. The TL AQDMP outlines mitigation measures and best management practices (BMPs), monitoring, adaptive management, and a follow-up monitoring program. The Plan identifies dust-emitting sources, dust mitigation measures, and contingency measures in the event that primary control measures are not effectively controlling dust emissions.

The objectives of the TL AQDMP are to:

- Identify TL project activities which may impact emissions;
- Establish measurable goals and targets to air quality and emissions management;
- Protect the air quality through the development of environmental mitigation measures associated with construction and operations activities;
- Address air quality related environmental aspects in the planning, design, and execution phases of the TL project;
- Implement BMPs for air emissions;
- Describe the management practices expected for all employees, contractors, and subcontractors related to the air quality and emissions management; and
- Identify the process for recording, reporting, and correcting non-compliance related to the TL AQDMP.

The TL AQDMP is linked to the Transmission Line Integrated Vegetation Management Plan (TLIVMP); Transmission Line Reclamation and Closure Plan (TLRCP); Transmission Line Surface Erosion Prevention and Sediment Control Plan (TLSEPSCP); Transmission Line Construction Environmental Management Plan (TL CEMP); Transmission Line Wildfire Management Plan (TL WMP); and the Wildlife Mitigation and Management Plan (WMMP).

1.3 Scope

The scope of this TL AQDMP includes all TL construction activities and is a standalone document. The scope of the TL AQDMP is to enhance existing policies and procedures for all relevant stakeholders. The TL AQDMP is supplementary to, and does not replace or override, any existing Government legislation, and associated Regulations.

2.0 Roles and Responsibilities

BW Gold has the obligation of ensuring that all commitments are met and that all relevant obligations are made known to mine personnel and site contractors during all phases of the mine life. A clear understanding of the roles, responsibilities, and level of authority that employees and contractors have when working at the mine site is essential to meet Environmental Management System (EMS) objectives. The BW Gold Construction Manager (CM) and Environmental Manager (EM) is responsible for communicating with EMBC, and for notifying the Ministry of Environment and Climate Change Strategy (ENV) depending on the environmental impact.

Table 2-1 provides an overview of general environmental management responsibilities during all phases of the mine life for key positions that will be involved in environmental management. This table also includes roles and responsibilities for the TL AQDMP. Other positions not specifically listed in Table 2-1 but who will provide supporting roles include independent environmental monitors, Independent Tailings Review Board, TSF qualified person, and other qualified persons and qualified professionals.

Table 2-1: Blackwater Roles and Responsibilities

Position	Responsibility
Chief Executive Officer (CEO)	The CEO is responsible for overall Project governance. Reports to the Board.
Chief Operating Officer (COO)	The COO is responsible for engineering and Project development and coordinates with the Mine Manager to ensure overall Project objectives are being managed. Reports to CEO.
Vice President (VP) Environment & Social Responsibility	The VP is responsible for championing the Environmental Policy Statement and EMS, establishing environmental performance targets, and overseeing permitting. Reports to COO.
General Manager (GM) – Development	The GM is responsible for managing project permitting, the Project's administration services and external entities, and delivering systems and programs that ensure Artemis's values are embraced and supported: Putting People First, Outstanding Corporate Citizenship, High Performance Culture, Rigorous Project Management and Financial Discipline. Reports to COO.
Mine Manager	The Mine Manager, as defined in the Mines Act, has overall responsibility for mine operations, including the health and safety of workers and the public, Environmental Management System (EMS) implementation, overall environmental performance and protection, and permit compliance. The Mine Manager may delegate their responsibilities to qualified personnel. Reports to GM.
Construction Manager (CM)	The CM is accountable for ensuring environmental and regulatory commitments and obligations are being met during the construction phase, including TL AQDMP implementation and compliance. Reports to GM.

Position	Responsibility
Environmental Manager (EM)	The EM is responsible for the day-to-day management of the Project's environmental programs, compliance with environmental permits, and updating EMS and MPs. The EM or designate will be responsible for reporting non-compliance to the CM, and Engineering, Procurement, and Construction contractor (EPC), other contractors, the Company, and regulatory agencies, where required. If TARP triggers are observed, the EM is responsible for notifying the EAO, EMPR, NHA, Indigenous Groups, and the public. The notification will include both a technical report and a plain language summary of the technical report. Supports the CM with TL AQDMP implementation and compliance, and reports to Mine Manager.
Departmental Managers	Departmental Managers are responsible for implementation of the EMS relevant to their areas. Reports to Mine Manager.
Indigenous Relations Manager	Indigenous Relations Manager is responsible for Indigenous engagement throughout the life of mine. Also responsible for day-to-day management and communications with Indigenous groups. Reports to EM.
Community Relations Advisor	Community Relations Advisor is responsible for managing the Community Liaison Committee and Community Feedback Mechanism. Reports to Mine Manager.
Environmental Monitors	Environmental Monitors (includes Environmental Specialists and Technicians) are responsible for tracking and reporting on environmental permit obligations through field-based monitoring programs. Report to EM.
Aboriginal Monitors	Aboriginal Monitors are required by EAC #M19-01 Condition 17 and will be responsible for monitoring the Project's potential effects on Aboriginal interests. Aboriginal Monitors will be involved in adaptive management and follow-up monitoring programs.
Employees and Contractors	Employees and Contractors are trained and responsible for being aware of permit requirements specific to their roles and responsibilities, including the TL AQDMP. If fugitive dust concerns are raised in concern with the TL AQDMP, they shall report to their site supervisor who will relay to the EM and/or CM. Report to departmental managers.
Qualified Professionals and Qualified Persons	Qualified professionals and qualified persons will be retained to review objectives and conduct various aspects of environmental and social monitoring as specified in EMPs and social MPs.

BW Gold will employ a qualified person as an Environmental Manager (EM) who will ensure that throughout the Construction phase (including the construction of the TL), the EMS requirements are established, implemented, maintained, and that environmental performance is reported to management for review and action. The EM is responsible for retaining the services of qualified persons or qualified professionals with specific scientific or engineering expertise to provide direction and management advice in their areas of specialization. The EM will be supported by a staff of Environmental Monitors that will include Environmental Specialists and Technicians and a consulting team of subject matter experts in the fields of environmental science and engineering.

During the Construction phase, the Engineering, Procurement, and Construction (EPC) contractor and subcontractors, will report to the Construction Manager (CM). The EPC contractor will be responsible for ensuring that impacts are minimized, and environmental obligations are met during the Construction phase. For non- EPC contractors, who will perform some of the minor works on site, the same reporting structure, requirements, and responsibilities will be established as outlined above. BW Gold will maintain overall responsibility for management of the construction and operation of the mine site and will therefore be responsible for establishing employment and contract agreements, communicating environmental requirements, and conducting periodic reviews of performance against stated requirements.

The CM is accountable for ensuring that environmental and regulatory commitments/obligations are being met during the construction phase on site, including the TL AQDMP. The EM will be responsible for ensuring that construction activities are proceeding in accordance with the objectives of the EMS, associated MPs, and TL AQDMP. The EM or designate will be responsible for reporting non-compliance to the CM, EPC contractor, other contractors, the Company, and regulatory agencies, where required. The EM or designate will have the authority to stop any construction activity that is deemed to pose a risk to the environment; work will only proceed when the identified risk has been addressed and concerns rectified.

Environmental management during operation of the TL project will be integrated under the direction of the EM, who will liaise closely with Departmental Managers and will report directly to the Mine Manager. The EM will be supported by the VP of Environment and Social Responsibility in order to provide an effective and integrated approach to environmental management and ensure adherence to corporate environmental standards. The EM will be accountable for implementing the approved MPs (including TL AQDMP) and reviewing them periodically for effectiveness. Departmental Managers will be directly responsible for implementation of the EMS and MPs/standard operating procedures) relevant to their areas. It is expected that during operations of the TL project that the operations, inspection, and maintenance/repair of the TL will fall under the Mine Site Services Department, with some of the services being assigned to qualified consultants and contractors. All employees and contractors are responsible for daily implementation of the practices and policies contained in the EMS and TL AQDMP.

During closure and post-closure staffing levels will be reduced to align with the level of activity associated with these phases. Prior to initiating closure activities, BW Gold will revisit environmental and health and safety roles and responsibilities to ensure the site is adequately resourced to meet permit monitoring and reporting requirements. The Mine Manager will have overall responsibility for Closure and Post-closure activities.

Pursuant to Condition 19 of the EAC, BW Gold has established an Environmental Life of Mine Committee (ELoMC) to facilitate information sharing and provide advice on the development and operation of the Project, and the implementation of EAC conditions, in a coordinated and collaborative manner. Committee members include representatives of the EAO, Ulkatcho First Nation (UFN), Lhoosk'uz Dene Nation (LDN), Nadleh Whut'en First Nation (NWFN), Stellat'en First Nation (StFN), Saik'uz First Nation (SFN), Nazko First Nation (NFN), Ministry of Energy, Mines and Low Carbon Innovation (EMLI), ENV, and Ministry of Forests, Lands, Natural Resource Operations and Rural Development.

Pursuant to Condition 17 of the EAC, Aboriginal Group Monitor and Monitoring Plan, BW Gold will retain or provide funding to retain a monitor for each Aboriginal Group prior to commencing construction and through all phases of the mine life. The general scope of the monitor's activities will be related to monitoring for potential effects from the Project on the Aboriginal Group's Aboriginal interests.

The TL Engineering Procurement and Construction Management or Engineering, Procurement, and Construction contractor roles and responsibilities relating to environmental management, industrial and domestic waste management, and environmental protection are identified below in Table 2-2.

Table 2-2: Transmission Line Construction Contractor Roles and Responsibilities

Role	Responsibility
Contractor Construction Manager (CCM)	The Contractor Construction Manager (CCM) has ultimate responsibility for construction proceedings, including worker and public health and safety and environmental protection. The CCM will ensure the implementation of training programs as well as support the Blackwater Gold Environmental Policy. The CCM will ensure that adequate support and resources are made available for the implementation and maintenance of the Environmental Management System (EMS), including the TL AQDMP implementation and review. The CCM may, as needed, delegate their duties to Qualified Professional (QPs). Report to the BW Gold Construction Manager.
Contractor Construction Superintendents	The Contractor Construction Superintendents have an administrative responsibility and requirement to act upon the directions, guidance, and support of the Construction Manager. They are resources to the CCM, and have the following responsibilities: • Learning and following the TL AQDMP in relation to their work; • Support the implementation of the Blackwater Gold Environmental Policy; • Ensure that environmental matters are given consideration in pre-planning of construction activities, budgets, training, and operations; and • Ensure that workers under their supervision are made aware of known, or reasonably foreseeable, environmental aspects where they work.
Construction Employees, Contractors, and Subcontractors	• Employees have general responsibilities for environmental protection, which include: – Learning and following the TL AQDMP in relation to their work; – Supporting the Blackwater Gold Environmental Policy; – Supporting implementation of EMPs; – Cooperating with the Blackwater Environment Committee representative(s); – Learning and following environmental best practices and procedures relevant to their work; – Following instructions and directives given by supervisors; – Operating equipment in an environmentally responsible manner to avoid environmental impacts; – If training another worker, ensuring that they are properly completing all required tasks and responsibilities in accordance with environmental best practices procedures; – Reporting all environmental incidents immediately to their supervisor, who will expedite a response to address the incident; – Participating in mitigating or minimizing harm to the environment should an environmental incident occur; and – Asking for help or information when unsure how to perform a task without compromising social, cultural, archaeological, or environmental values.

3.0 Project Setting

3.1 Emissions and Physical Location Overview

The TL AQDMP addresses the new approximately 135 km overland transmission line (TL) that will connect the mine to the BC Hydro grid, as described in the Project Overview. There is an absence of heavy industrial air emission sources within the local and regional project areas that could add to the TL emissions aside from the mine itself. The TL activities determined to contribute to cumulative air quality effects are those associated with combustion emissions, unpaved roads, and material handling as these activities may generate air emission such as TPM, PM_{10}, $PM_{2.5}$, NO_X, and CO.

Of the listed general land uses below, mining exploration and forestry resource use are the activities that may have the largest non-TL cumulative effects contribution to air quality during TL construction. The other activities listed are not expected to create measurable changes in the air quality. Known general land uses within the region include:

- Protected areas and parks;
- Recreation/tourism use (e.g., all-terrain vehicle use);
- Forestry and timber resource use;
- Hunting/trapping/guide outfitting;
- Fishing and aquaculture;
- Agriculture and grazing;
- Range use;
- Mining, exploration, and mineral tenures;
- Land ownership and tenures;
- Recreational and commercial use of waterways;
- Groundwater resource use; and
- Surface water resource use.

Local residents and Indigenous groups and their members have expressed interest in the potential effects on air quality during TL construction and operations. These groups' comments during the engagement and consultation process have provided insights into traditional, ecological, and community knowledge, which is defined as a body of knowledge built up by a group of people through generations of living in close contact with nature. This includes unique knowledge about the local environment, how it functions, and its characteristic ecological relationships. No specific sensitive environmental receptors specific to the TL are identified at this time to be monitored. Mine sensitive receptors include the Project operations camp, and Tatelkus Lake Indian Reserve 28 (tatelkus Lake 28), as indicated in the Project Air Quality and Fugitive Dust Management Plan (AQDMP)

During a meeting with the Nazko First Nation (NFN), members emphasized that clean air, including being free of dust, is important to ensure medicinal plants and waters are clean to eat and drink. Lhoosk'uz Dene Nation (LDN) and Saikuz First Nation (SFN) elders also noted their concerns about the potential effects of the Project, such as the impact of dust and emissions on air quality.

4.0 Identification of Potential Sources or Activities which Generate Fugitive Dust

4.1 Source List Review

Fugitive dust will be generated from construction activities including material handling and resuspended road dust. Other particulate sources include diesel emissions and industrial burning.

TL project construction is anticipated to start in late 2022. Air quality and fugitive dust management is critical for safety, and for preventing potential effects to local and regional wildlife populations and habitats. The Project has adopted an air quality and emissions management system that recognizes and responds to the issue of gaseous and particulate emissions at all stages of the Project, from planning, construction, operation, closure, and post closure. This includes systematically identifying sources, predicting contaminants levels, evaluating potential effects on human health and the environment, and incorporating prediction and control measures.

During construction and operations phases of the TL, many of the emissions will result from diesel fuelled internal combustion engines, industrial burning, and fugitive dust. Emitted substances will be dispersed into the surrounding air and concentration levels will depend on emission rates, release characteristics, meteorological parameters, and topography. Due to the physical length of the TL, meteorological parameters and topography are expected to vary. Diesel emission levels depend on engine design parameters, emissions controls, equipment maintenance, and the power rating, and do not depend on TL project phase or activity. Industrial burning of debris piles is addressed in the TL WMP, along with inspections and maintenance of fire equipment. Timing of burning activities depends on local burning bans. Fugitive dust is the primary source of TL project air emissions. Potential dust sources include material handling/rehandling, construction and use of unpaved roads, blasting, compaction, drilling, grading, material loading and unloading.

Air quality and emissions management defines the programs and procedures that have been, or will be, developed for ensuring that all air quality risks are adequately addressed, prevented, and controlled for all phases of the TL project including design, construction, operations, and decommissioning/closure. This includes the following activities:

- Timber harvesting;
- Road construction, including bridges;
- Material handling;
- Equipment selection (vehicles, drilling and process equipment, etc.);
- Site clearing;
- Vehicle traffic and use of heavy equipment (paved and unpaved roads); and
- Blasting.

In order to quantify cumulative air quality effects, it is necessary to obtain spatially and temporally specific activity information so that emissions can be estimated and assigned to a specific geographic area. By their nature, forestry resource use and mining exploration are activities that move continuously and have a relatively low level of activity in any specific location over a significant period of time. This would be the same case for TL construction. Therefore, the TL project air quality effects are expected to be lower than an activity that remains in one location for a longer period of time.

4.2 Source List Update Procedure

The TL AQDMP's source list shall be reviewed as needed to reflect current site conditions. If fugitive dust sources are removed or new sources are added/observed on site by employees, contractors, EM, or CM, the TL AQDMP will be updated by the EM. At minimum, the source list will be reviewed annually by the EM.

4.3 Fugitive Dust Source List

Table 4-1 below will be updated to list and identify fugitive dust sources during all phases of TL construction.

Table 4-2 provides an overview of the TL project activities anticipated to emit fugitive dust by TL project phase.

Table 4-1: TL Fugitive Dust Source List

Unique ID	Location	Potential Source	Dust Generating Material	Generation Conditions	Additional Comments
Stockpile Area 1 (SP-001)	Designated stockpile area	Wind erosion, material handling	Fine aggregate 0.05mm – 1mm, 1mm – 2 mm	Windy, dry, or hot days, material handling operations	Location will change as TL construction moves along 135 km stretch.
Unpaved Road 1 (UR-001)	Main activity area for transport vehicles	Vehicle traffic	Road dust, aggregate, diesel emissions	Windy, dry, or hot days, material handling operations, vehicle equipment condition, number of vehicle passes, vehicle weight	Location will change as TL construction moves along 135 km stretch.
Blasting Zone 1 (BZ-001)	Blasting zones (if required)	Blasting	Soil/rock composition of blast site	Windy, dry, or hot days, blast size, material handling operations	Location will change as TL construction moves along 135 km stretch.
Staging Area 1 (ST-001)	Staging area	Vehicle traffic	Road dust, aggregate, diesel emissions	Windy, dry, or hot days, vehicle traffic, vehicle equipment condition, number of vehicle passes, vehicle weight	Location will change as TL construction moves along 135 km stretch.
Drilling Area 1 (DR-001)	Drilling area	Drilling	Soil/rock composition of drilling site	Windy, dry, or hot days, drilling duration, material handling operations	Location will change as TL construction moves along 135 km stretch.

Unique ID	Location	Potential Source	Dust Generating Material	Generation Conditions	Additional Comments
Road Construction 1 (RC-001)	Incomplete road construction area	Road construction operations, material handling	Road dust, aggregate, diesel emissions	Windy, dry, or hot days, material handling operations, vehicle equipment condition, number of vehicle passes, vehicle weight	Location will change as TL construction moves along 135 km stretch.
Borrow Pit 1 (BP-001)	Designated borrow pit area	Material handling	Aggregates, soil	Windy, dry, or hot days, vehicle equipment condition, material handling operations	Location will change as TL construction moves along 135 km stretch.
Screening Area 1 (SC-001)	Designated screening area	Screening, material handling	Aggregate	Windy, dry, or hot days, material handling operations	Location will change as TL construction moves along 135 km stretch.
Clearing Area 1 (CL-001)	Clearing area	Clearing Equipment, material handling	Sawdust, upturned soil	Windy, dry, or hot days, clearing duration, vehicle equipment condition, material handling operations	Location will change as TL construction moves along 135 km stretch.
Transmission Line Construction 1 (TL001)	Incomplete transmission line construction area	Material Handling	Aggregate, soil	Windy, dry, or hot days, vehicle equipment condition, material handling operations	Location will change as TL construction moves along 135 km stretch.
Industrial Burning Area (IB-001)	Designated pile burning area	Material candling, burn piles	Wood combustion	Refer to TL WMP. Schedule varies on conditions.	Location will change as TL construction moves along 135 km stretch.

Table 4-2: TL Activities Resulting in Fugitive Dust by Phase

Construction	Operations	Closure	Post-closure
• Land clearing and earthworks for all on-site components • Construction and use of unpaved access roads • Surface blasting and drilling • Construction of TL project roads • Construction of the transmission line • stockpiles, borrow areas, and laydown areas • Aggregate extraction from borrow pits • Borrow and aggregate screening areas • Industrial burning	• Use of unpaved surfaces including roads • Road maintenance • Progressive reclamation, restoration activities	• Use of unpaved roads • Road maintenance • Progressive reclamation, restoration activities	• Use of unpaved roads • Road maintenance

5.0 Identification of Potential Effects of Fugitive Dust

The greatest fugitive dust generation will occur during the TL project construction phase. Fugitive dust emitted from construction operations may have potential adverse effects on human health and pose environmental risks both on and off site.

The United States Environmental Protection Agency (US EPA, 2021) states that “the size of particles is directly linked to their potential for causing health problems. Small particles less than 10 micrometers in diameter pose the greatest problems, because they can get deep into your lungs, and some may even get into your bloodstream.” Potential environmental effects include visibility impairment, environmental damage, and materials damage (US EPA, 2021). Potential effects listed by the US EPA are summarized in the Table 5-1. The impact depends on fugitive dust concentration, particulate sizes, and location of operations and receptors.

Table 5-1: Potential Health and Environmental Effects of Particulate Matter

Potential Health Effects	Potential Environmental Effects
• premature death in people with heart or lung disease • nonfatal heart attacks • irregular heartbeat • aggravated asthma • decreased lung function • increased respiratory symptoms, such as irritation of the airways, coughing or difficulty breathing.	• reduced visibility (haze) from fine particulates • making lakes and streams acidic • changing the nutrient balance in coastal waters and large river basins • depleting the nutrients in soil • damaging sensitive forests and farm crops • affecting the diversity of ecosystems • contributing to acid rain effects • staining and damaging stone and other materials, including culturally important objects such as statues and monuments

(US EPA, 2021)

6.0 Air Quality and Fugitive Dust Management

Particulate and gaseous contaminant emissions management will be applied throughout all phases of the TL project lifecycle, including construction, operations, and decommissioning/closure. Most fugitive dust emissions occur from vehicle travel on unpaved roadways (e.g., access roads) resuspending particulate matter (PM) into the air, and from materials handling equipment (e.g., bulldozers, graders, trucking). Other mitigation measures for $PM_{2.5}$, SO_2, NO_2, and CO from diesel fuelled equipment relate to engine emission controls, as those substances are generated as combustion by-products.

6.1 Best Management Practices (BMP)

The following procedures for dust management will apply to all phases of the TL project. These mitigation and preventative measures will be monitored and reviewed for continuous improvement opportunities as the TL project progresses. These procedures may include, but are not limited to, the following:

- Minimize clearing of vegetation for construction areas to limit surface disturbance;
- Minimize drop heights for material handling, loading, and unloading;
- Progressive reclamation of disturbed areas will occur as soon as feasible;
- Maintenance of unpaved roads which will be regularly compacted and kept in good repair;
- Use of coarse aggregate for road surfaces with low silt content;
- Vehicles will be driven at designated speeds on project roads;
- Roadways and stockpiles will be wetted as needed to minimize dust from grading, vehicle traffic, and wind erosion when ambient air temperatures permit;
- Water or spray quantities used will be documented;
- Reporting incidents involving excessive dust on site;
- Weather preparedness; and
- Employee training.

6.2 Site Specific Mitigation Measures

To minimize gaseous emissions from diesel combustion on site, the EM will ensure that all equipment and vehicles will be maintained to ensure that they are operating as per manufacturers specifications. This may include equipment and vehicles with Canadian Tier emissions standards. All off-road vehicles will use ultra-low sulphur diesel (15 parts per million [ppm] maximum), as required under Canadian emissions regulations. Smoke emissions from industrial burning are also expected to occur. The EM will ensure that the TL WMP is followed and that burning times and emissions follow OBSCR requirements to minimize impacts.

Most TL project fugitive dust emissions are expected to occur from vehicle travel on unpaved roads (e.g., access roads) and from material handling (bulldozers, graders, trucking). This will be mitigated using a combination of preventative strategies and mitigation controls shown in Table 6-1. The EM and CM will be responsible to ensure that strategies and controls are implemented and followed as required. Contractors and employees will require training to identify when additional mitigation measures are required.

Table 6-1: Fugitive Dust Mitigation Measures

Unique ID	Mitigation Measures
Stockpile Area 1 (SP-001)	• Minimize stockpile area as much as possible. • Locate stockpile areas where wind speed is minimal or blocked. • When practicable in an active work zone, water stockpiles on dry windy (average wind speed above 10 m/s) days above freezing temperatures. • Minimize material drop heights where possible when adding material to stockpiles. • Cover stockpiles if abandoned for a long period of time. • When unloading material, piles should form low piles that extend horizontally, where practical. • Employees involved in material handling or management will receive training by a qualified person on the importance of minimizing material drop height (from excavator to truck, conveyor to stockpile, etc.) to reduce fugitive dust. • Ensure a supply of water and available transportation vehicles, weather depending.
Unpaved Road 1 (UR-001)	• Limit vehicle speed on site to a maximum of 50 km/hr. • Minimize unpaved road distances for vehicle travel where possible. • Road surfaces will be constructed of coarse aggregate with low silt content where additional road surfacing material is required. • Water or apply calcium chloride a to suppress resuspension of particulates on dry and/or high activity days. • Further reduce speed limits on Project-owned roads if weather conditions cause fugitive dust emissions and dust cannot be controlled by watering. • Ensure a supply of water and available transportation vehicles, weather depending (non-freezing conditions).
Blasting Zone 1 (BZ-001)	• Schedule blasting for favourable moist conditions where possible • Use blasting mats, when possible, where high particulate suspension is expected • Use weather forecasts to inform blasting plan (e.g., wind forecast, lightning and thunder warnings). • Immediately prior to blasting, the “Blast Engineer / Blast Coordinator” must check weather conditions to determine if the blast is likely to cause any dust or fume impacts on the surrounding environment. • Where dust or fume impacts on employees and environment cannot be avoided, blasting must be postponed until weather conditions improve. The CM will decide when to postpone blasting.
Staging Area 1 (ST-001)	• Minimize staging area as much as possible • Locating staging areas where wind speed is minimal or blocked
Drilling Area 1 (DR-001)	• Schedule drilling for favourable moist conditions where possible • Use wet drilling during very dry conditions (less than 0.25 mm/day of precipitation in the previous week)

Unique ID	Mitigation Measures
Road Construction 1 (RC-001)	• Limit vehicle speed on site to a maximum of 50 km/hr. • Minimize unpaved road distances for vehicle travel where possible. • Watering or application of calcium chloride a to suppress resuspension of particulates on dry and/or high activity days. • Minimize material drop heights where possible. • Road surfaces will be constructed of coarse aggregate with low silt content where additional road surfacing material is required.
Borrow Pit 1 (BP-001)	• Minimize pit area as much as possible. • Apply water when temperatures are above freezing and there are very dry conditions (less than 0.25 mm/day of precipitation in the previous week). • Employees involved in material handling or management will receive training by a qualified person on the importance of minimizing material drop height (from excavator to truck, conveyor to stockpile, etc.) to reduce fugitive dust. • Develop new borrow areas only when and as required (to be determined by the Construction Manager). • Once suitable materials have been salvaged, place topsoil on disturbed areas and seed using a native seed mix to re-establish vegetative cover as soon as reasonably possible. • When unloading material, piles should form low piles that extend horizontally. • Minimize drop height from loaders and excavators (shovels) to the truck.
Screening Area 1 (SC-001)	• Minimize material drop heights where possible. • Equip the screener circuits with onboard water dosing during times of the year above freezing temperatures or other dust suppression measures (e.g., reagents) systems. • Apply water when temperatures are above freezing and there are very dry conditions (less than 0.25 mm/day of precipitation in the previous week). • Check cover for tears, holes, and cracks on a monthly basis. Repair as soon as possible.
Clearing Area 1 (CL-001)	• Minimize clearing area as much as possible. • Limit vehicle speed on site to a maximum of 50 km/hr. • Minimize material drop heights where possible.
Transmission Line Construction 1 (TL001)	• Minimize material drop heights where possible.
Industrial Burning Area (IB-001)	• Refer to TL WMP for combustion schedule and mitigation requirements.

7.0 Plan Implementation

The TL AQDMP is a living document that will evolve over time in response to monitoring results and regulatory changes. The plan incorporates adaptive management as follows:

- **Plan**
  - Source identification and characterization;
  - Qualitative visual assessment of particulate emissions;
  - Identification of contributing factors that favour dust generation; and
  - Description of fugitive dust control for each source.
- **Do**
  - Schedule for implementation and operation of control measures;
  - Description of maintenance and record keeping procedures for control and monitoring equipment; and
  - Training procedures.
- **Monitor**
  - Inspection and maintenance procedures; and
  - Record keeping to verify ongoing implementation of plan.
- **Adjust**
  - Review of effectiveness of control measures; and
  - Update the plan as required.

7.1 Training

Employees and contractors will receive training in fugitive dust management and air quality awareness on their arrival on site through an environmental on-boarding training session and prior to the start of work as part of the Site Orientation. The purpose of this training is to provide all site personnel with a basic level of environmental awareness and an understanding of their obligations regarding compliance with regulatory requirements, commitments, and best practices.

All those responsible for the management, implementation, and operation of any aspect of this plan will be competent for their role. All staff will attend site orientation where the contents, requirements and commitments made in this plan will be communicated. Staff will be adequately trained for their roles to implement this plan and will be aware of BW Gold's commitments to uphold this plan. Training will cover safety and measures to mitigate effects on ecosystems, soils, and vegetation and to emphasize the importance of following and implementing the TL AQDMP. Targeted training related to dust management will be provided to individuals and/or groups of workers assuming a specific authority or responsibility related to air quality. BW Gold will regularly review and update the training and awareness plan based on changes in training needs and regulatory requirements.

Employee education and outreach on access management will be supported by:

- Development and delivery of educational material to site personnel; and
- Maintaining updated information related to access management at Blackwater in a location available to employees.

Prior to the commencement of work on the TL project, all personnel will:

- Review and be aware of the requirements of the TL AQDMP;
- Be aware of their legislative requirements, specifically including but not limited to:
  - WHMIS, Safety Data Sheets, Transportation of Dangerous Goods, Occupational Health and Safety, and relevant British Columbia Air Quality Objectives;
- Be trained in and be aware of:
  - Safety and emergency response procedures; and
  - Evacuation procedures.

Contractors and subcontractors are required to hold regular documented safety meetings at a frequency agreed to by Proponent project management. Safety meetings must focus discussion on hazards and risks specific to the work being performed and recent incidents within the workplace. Additionally, as a minimum, discussions will include past meeting concerns, findings from workplace inspections, and reported near misses. These meetings must also include air quality and fugitive dust risks and incidents. If a potential dust concern is observed, it shall be reported to the EM.

Proponent management will attend Contractor's safety meeting to reinforce their commitment to safety, provide opportunities for direct contact with site personnel, and monitor that the quality of meetings is adequate.

These meetings include but are not limited to:

- Daily Crew Talks;
- Daily Safe Act Observations (SAOs) by Supervisors;
- Daily Risk Assessment Inspection of Work Area;
- Weekly Management Meetings; and
- Monthly Management Meetings.

7.2 Monitoring and Maintenance

The purpose of this monitoring component is to document the efficacy of the mitigation measures implemented and to meet regulatory requirements at the TL project site. The Plan will ensure that project activities are conducted according to applicable legislation and the conditions of all project approvals. Monitoring will be carried out in order to meet permit and reporting requirements. It will also be used as a tool to determine the efficacy of the mitigation measures implemented.

The TL AQDMP monitoring program largely relies on qualitative visible observations on site, while paying attention to weather conditions as shown in the Trigger Action Response Plan (TARP). Depending on observed conditions, TARP may trigger reporting of on-site emissions for mitigative actions and/or review of the TL AQDMP. TL personnel will be trained to be observant for dust related concerns which may arise. These observations, together with meteorological conditions and mitigation efforts taken to deal with a problem, will be recorded and included in monthly and annual reports. Visual monitoring will focus on areas where there are active surface earthworks, unpaved roads and overburden and soil stockpiles. Visual monitoring will occur on a daily basis at all locations where fugitive dust generation is occurring. At minimum, monitoring report summaries will be reviewed annually to determine any emissions trends and to revise operating practices or monitoring protocols as required.

The Proponent will collaborate as required with other government-sponsored monitoring programs as required to measure the effects of air quality occurring in the TL project area during the construction and operations phases of the TL project. The monitoring program will be submitted by the EM for review to the appropriate regulatory authorities for comment before construction/operations begins.

7.3 Trigger Action Response Plan (TARP)

The Trigger Action Response Plan (TARP) is intended to provide an early-warning system such that when defined action levels are triggered there is sufficient time to prevent irreversible adverse environmental and health effects. Workers on site shall assess daily weather conditions and make continuous visual observations on-site to determine which TARP triggers and actions/responses are required (Table 7-1). Site conditions and TARP level of alert shall be recorded by site supervisors in an observation logbook daily. The CM will summarize the recorded observations and report monthly to BW Gold. The EM and CM are responsible for ensuring that TARP is implemented, followed, and up to date. If there is an air quality advisory issued by ENV that affects the region where the mine is located, the EM will determine if an adjustment to a higher alert level described in Table 7-1 is required to further mitigate dust emissions.

Table 7-1: On-site Trigger Action Response Plan (TARP)

Component	Location	Level	Trigger	Management Response
Fugitive Dust	Unpaved Roads	None	• Dust plume less than half the height of a truck tire.	• No action. Continue work in accordance with site management procedures.
		Low	• Dust plume less than half the size of a truck for any period of time up to 30 minutes.	• Limited watering of high traffic areas. • Repeat visual inspection every 2 hours depending on weather.
		Medium	• Dust plume same size as a truck extending beyond local areas for periods longer than half a day.	• Continuous watering of high traffic areas until dust plume subsides. • Speed limit restrictions in high traffic areas.
		High	• Dust plume greater than the size of a truck for periods longer than 1 day, or when dust plumes extend beyond the active construction area.	• Increase frequency of watering and if not successful examine longer use of alternative dust suppressants (e.g., calcium or magnesium chloride, lignin compounds, environmentally friendly oils, or clay additives). • Speed limit restrictions may be required if dust cannot be controlled by watering. • Closure of certain routes may be required if dust cannot be controlled by watering or speed restrictions. • Reassessment TL AQDMP may be required.
	Surface earthworks, staging, clearing, blasting, drilling	None	• Minor localized dust during construction and normal operations.	• No action. Continue work in accordance with site management procedures.
		Low	• Visible dust plumes rising over 2 m above the active construction area for longer than 30 minutes.	• Minimize material movement in areas with active construction or operation and heavy equipment use. • Limit timing of blasting/drilling so not concurrent with other high dust generating activities. • Minimize drop heights for material handling.

Component	Location	Level	Trigger	Management Response
		Medium	• Triggers per level 1 but with dust plume extending beyond local area for periods longer than half a day.	• Application of water to exposed construction area (if this is a source). • Limit timing of blasting/drilling for more favourable weather conditions.
		High	• Extensive areas of dust generation with large dust plumes for periods longer than 1 day or when dust plumes extend beyond the active construction area.	• Increase frequency of watering and if not successful apply gravel to exposed construction area (if this is a source). • Investigate long term solutions if dust plumes persist. • Reassessment TL AQDMP may be required.
	Stockpiles	None	• Minor localized dust during construction and normal operations.	• No action. Continue work in accordance with site management procedures.
		Low	• Visible dust plumes rising over 2 m above the ground for longer than 30 minutes.	• Turn on spray bar sprinklers or apply other water application where applicable. • During periods where temperatures are below freezing add reagents to control dust.
		Medium	• Triggers per level 1 but with dust plume extending beyond local area for periods longer than half a day.	• Increase the rate of water application using spray bar sprinklers. • During periods where temperatures are below freezing, add reagents to control dust.
		High	• Extensive areas of dust generation with large dust plumes for periods longer than 1 day or when dust plumes extend beyond the active construction area.	• Examine the possibility of re-engineering the spray bar sprinklers, or reassessment of water application to provide more effective water coverage. • Reassessment TL AQDMP may be required.
	Material handling,	None	• Minor localized dust during construction and normal operations.	• No action. Continue work in accordance with site management procedures.

Component	Location	Level	Trigger	Management Response
	transfer locations, screening	Low	• Visible dust plumes rising over 2 m above the ground for longer than 30 minutes.	• Turn on spray bar sprinklers or apply other water application where applicable. • During periods where temperatures are below freezing add reagents to control dust.
		Medium	• Triggers per level 1 but with dust plume extending beyond local area for periods longer than half a day.	• Increase the rate of water application. • During periods where temperatures are below freezing, add reagents to control dust.
		High	• Extensive areas of dust generation with large dust plumes for periods longer than 1 day or when dust plumes extend beyond the active construction area.	• Examine the possibility of re-engineering the spray bar sprinklers, or reassessment of water application to provide more effective water coverage. • Reassessment TL AQDMP may be required.

7.4 Record Keeping

A copy of the following documents will be kept on hand and available on site:

- Transmission Line Air Quality and Fugitive Dust Management Plan;
- Transmission Line Industrial and Domestic Waste Management Plan;
- Transmission Line Fuel Management and Spill Control Management Plan; and
- Transmission Line Emergency Response Plan.

Records of all updates to these plans and audits performed to determine the adequacy of the plan must be stored with the plan for the entirety of the Transmission Line construction. If a Level 3 Alert is triggered by TARP, a record of the incident submitted to the CM and EM must include:

- Date, time, and location of dust event;
- Managers or people involved/reported to;
- Triggers observed and potential activity/activities contributing to the event; and
- Record of any immediate actions taken.

For a Level 3 Alert the CM and EM shall keep a record of:

- Dates and times of received and distributed documents;
- Responses and actions taken to address submitted incidents; and
- Records of the EM or CM follow ups with individuals involved to find out where improvements to the plan or training are required.

The EM will be responsible for ensuring dust events are logged, including details of the on-site activities, meteorological conditions, and the management actions taken. Records will be maintained for public complaints and dust visual observations.

8.0 Adaptive Management

The TL AQDMP is a “living” document and any plan revisions will be made in accordance with the plan this is appended to (Condition 20 – Air Quality and Fugitive Dust Management Plan) . The review will evaluate the effectiveness of the TL air quality and fugitive dust management. Performance metrics that will result in adaptive management are:

- Non-compliance with this plan;
- Measure of mitigation success;
- Response time;
- Number of un-reported events;
- Number of reported events;
- Timely completion of maintenance and inspections;
- Completion of required training; and
- Regulatory non-compliance orders associated with plan.

9.0 Reporting

Observations related to air quality and fugitive dust management will be:

- Reported by construction staff to their supervisors;
- Documented in an Observation Logbook; and
- Reported monthly by the Construction Manger to BW Gold on the content of the Observation Logbook.

All incidents of concern with air quality, fugitive dust emissions, along with spills, accidents, or observed instances of odour and/or petroleum product sheen in a watercourse will immediately be reported to the Construction Manager and the BW Gold EM regardless of quantity or location. The BW Gold EM is responsible for any required reporting to outside agencies. If TARP triggers are observed, the EM is responsible for notifying the EAO, EMPR, NHA, Indigenous Groups, and the public. The notifications to the EAO, EMPR, NHA, Indigenous Groups, and the public will include both a technical report and a plain language summary of the technical report.

Incidents related to air quality will be reported. Incidents reported on will also include any air quality complaints. Significant events will trigger an incident investigation (including a root cause analysis). Investigations will be done by senior staff from relevant Managers. Remedial action may involve:

- Additional training for personnel;
- Enhanced equipment maintenance or inspection program;
- Additional preventative infrastructure (containment berms, oil/water separators), etc.; and
- Review and/or revision of the TL AQDMP.

Annual reports generated for submission to regulatory agencies, First Nations, the public, and TARP reporting will include:

- Confirmation that the TL AQDMP is being implemented as written;
- The monitoring results;
- The effectiveness of mitigation measures;
- The number of dusting events that occurred;
- Any complaints received and the actions taken to address complaints; and,
- Any deficiencies identified in the TL AQDMP and corrective actions taken.

10.0 Qualified Professionals

This management plan has been prepared and reviewed by the following qualified professionals:

Dear Alexandra,

RE: 2023 Meteorological Monitoring Program Review

BW Gold Ltd. (BW Gold), a wholly owned subsidiary of Artemis Gold Inc. (Artemis), is developing the Blackwater Mine (the Blackwater Gold Mine; the Mine), which is located approximately 112 km southwest of Vanderhoof in central British Columbia (BC). BW Gold submitted a Joint Mines Act and Environmental Management Act Permits Application (the Joint Application) in November 2021, seeking approval to construct the Mine. To date, two permits have been issued under the provisions of the Environmental Management Act that require the continuous monitoring of meteorological parameters: Permit 110650 (the Air Discharge Permit) and Permit 110652 (the Effluent Discharge Permit); both permits were issued in May 2023. Knight Piésold Ltd. (KP) has provided technical support for the climate monitoring network for the Mine since early 2011.

Avison Management Services (Avison) has and continues to perform field visits related to these programs, with guidance provided by KP. To date, two climate monitoring stations have been commissioned at the Mine site: Blackwater Low and Blackwater High (the Stations). The maintenance procedures for the two stations follow the CSA R101:22 standards for Class 2 stations (CSA, 2022), as required by the Permits. Three snow course survey sites have also been established: SS1, SS2, and SS3. The snow sampling procedures follow the BC Snow Survey Sampling Guide (BC MOE, 1981).

1.0 MONITORING PROGRAM OVERVIEW

1.1 REGULATORY CONTEXT

This letter is intended to certify compliance with Section 5.2 and to satisfy the climatological portions of Section 6.1 h) and j) of the Air Discharge Permit (PE 110650). This letter is also intended to certify compliance with Section 4.5 and to satisfy Section 5.3.3 j) of the Effluent Discharge Permit (PE 110652). These permit conditions and the letter sections in which they are addressed are outlined in Table 1.1.

BLACKWATER GOLD PROJECT

2023 METEOROLOGICAL MONITORING PROGRAM REVIEW
PERMIT CONCORDANCE SUMMARY

Print Mar-05-24 8:02:46

Permit	Permit Section	Reporting Requirement	Section Where Requirement is Addressed
PE-110650	6.1 h)	Data capture results including the following as per Section 5.1.4 and 5.2.3	
	i.	The percentage of days the each of the monitors were available for the calendar year	Table 2.1
	ii.	The percentage of days the each of the monitors were available per quarter	Table 2.1
	iii.	Confirmation that the each of the monitors were serviced in accordance with the BCFSM (for meteorological stantions)	Section 3.0
	iv.	Confirmation that the results have not been invalidated by a quality assurance failure of as the result of the **Province's data validation procedures** (for meteorological stations)	Section 2.1
	6.1 j)	Results of the audit conducted on the monitors referenced in Table 2, as required by Section 5.2.4, including any remedial action implemented in response to audit findings	Section 1.3
PE-110652	4.5.1	The permittee must establish and maintain hourly meteorological monitoring at Blackwater Low and Blackwater High Meteorological Stations for wind speed, wind direction, std deviation of wind direction, air temperature, precipitation, solar radiation, net radiation, and relative humidity	Table 2.1
	4.5.2	For each parameter listed in section 4.5.1, valid data is required to be measured and reported for a minimum of 90% of the hours available in each calendar quarter. Hourly data for a parameter is considered valid if: (a) The instrument is serviced according to the requirements of the most recent version of the "British Columbia Field Sampling Manual" and the manufacturer's instructions, and (b) The data have not been invalidated as the result of the Ministry's Data Validation procedures as described in the "British Columbia Field Sampling Manual" dated 2013, or most recent version	Table 2.1
	4.5.3	The permittee must establish and maintain two snow course monitoring stations at suitable locations, a high elevation site near the TSF and a low elevation site within or downstream of the mine footprint. Snow course surveys must be collected monthly from January to June (inclusive) each year. Snow course surveys must be conducted in accordance with the procedures described in the "Snow Survey Sampling Guide" dated 2016 or most recent version	Section 2.4
	5.3.3 j)	A review of the meteorological monitoring program required in section 4.5, including:	
	i.	Description of measurement methods, field procedures and data calculation methods with interpretation	Section 2.0
	ii.	Summary table of the validation measurements recorded during the year	Section 1.3
	iii.	Visual representation of parameters recorded during the year as well as comparisons to historic data, where available	Figures A.1 - A.12

1.2 MINE FACILITIES

The locations of the two climate stations and three snow survey stations operated at the Blackwater Mine site are shown on Figure 1.1. The climate stations were installed by KP engineers and scientists with the support of Avison field technicians. The first station (Blackwater Low) was installed in July 2011 at an elevation of 1,050 meters above sea level (masl) (Figure 1.2), and the second station (Blackwater High) was installed in July 2012 at an elevation of 1,470 masl (Figure 1.3). The three snow survey sites (SS1, SS2, and SS3) were established in February 2012 and have been used to collect snow depth and snow water equivalent (SWE) data two to three times a year. Details of the climate and snow survey stations are provided in Table 1.2. Ongoing field visits to operate and maintain these stations are conducted by Avison, with quality assurance checks and guidance provided by KP.

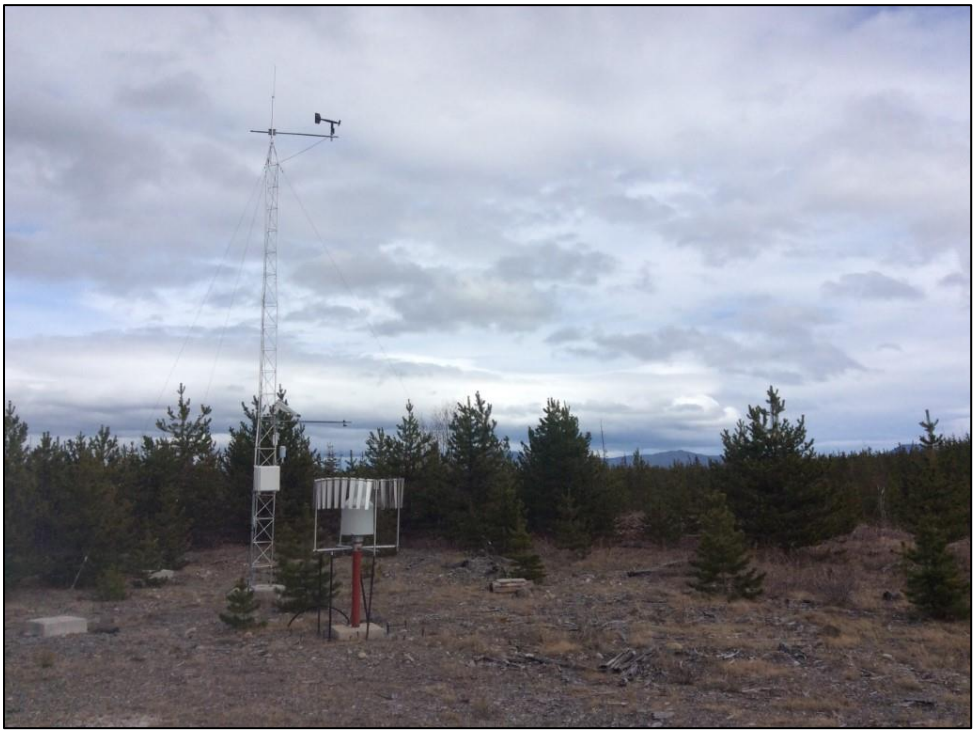

Figure 1.2 Blackwater Low Climate Station

Figure 1.3 Blackwater High Climate Station

Table 1.2 Summary of Site Climate and Snow Survey Stations

Station Name	Elevation (masl)	Easting (m)	Northing (m)	Status	Date Established
Blackwater High	1,470	376,626	5,894,012	Active	July 10, 2012
Blackwater Low	1,050	380,029	5,907,132	Active	July 22, 2011
SS1	1,412	374,638	5,894,891	Inactive as of April 2023	February 1, 2012
SS2	1,168	381,207	5,897,678	Active	February 1, 2012
SS3	1,051	380,029	5,907,132	Active	February 1, 2012

Blackwater High is the Mine's primary climate monitoring location, while Blackwater Low provides backup data, and the differences between the data from the two climate stations provides information pertaining to changes in conditions with changes in elevation (lapse rates and orographic effects). A Campbell Scientific CR1000 data logger is installed at each station, and data are collected at hourly intervals. Both data loggers are set to Pacific Standard Time (PST) to avoid data gaps and overlaps, and to be consistent with standard monitoring practices. Parameters and monitoring methods at each of the two stations are summarized in Table 1.3.

Table 1.3 Climate Station Monitored Parameters

Parameter	Measurement Method	Data Calculation Method
Wind (speed, direction, hourly standard deviation of direction)	Vane anemometer mounted 10 m above ground	Hourly mean for wind speed and direction
Air temperature and relative humidity	Temperature and humidity probe mounted 4 m above ground with a multi-plate passive solar radiation shield	Hourly mean
Precipitation	Weighing rain gauge outfitted with a single Alter windshield	Hourly sum
Net radiation	Radiometer	Hourly mean
Solar radiation	Pyranometer	Hourly mean

1.3 VALIDATION MEASUREMENTS

Sensors on the two climate stations are periodically calibrated by the manufacturers, as described in the Operational and Quality Assurance Plan (KP, 2023). No sensors required calibration in 2023; they were all calibrated in summer 2022. Validation measurements are taken during field visits, as needed. A summary of validation measurements taken in 2023 is provided in Table 1.4. The substantial difference between the temperature validation field measurement and the logger measurement at Blackwater Low is not believed to be indicative of a logger error since Blackwater Low's air temperature and humidity time series did not indicate a systematic sensor error. It is speculated that the noted temperature difference is likely due to sun exposure to the handheld measurement device, whereas the temperature probe on the climate station has a radiation shield.

Table 1.4 2023 Validation Measurements

Station	Parameter	Timestamp	Field Measurement	Logger Measurement
Blackwater Low	Air Temperature	Aug 1, 2023 10:38	16.5° C	14.0° C
Blackwater High		Aug 1, 2023 12:25	13.0° C	12.9° C

2.0 METEOROLOGICAL CHARACTERIZATION

This section describes the meteorological conditions measured at the Mine in 2023. In July of 2023, there were wildfires in the vicinity of the Mine. As discussed later in this section, the higher than normal temperatures and lower than normal precipitation conditions at the Mine site likely contributed to the fire risk. The hourly time series for all measured meteorological parameters are presented as figures in Appendix A and the corresponding hourly datasets are attached as an Excel file.

2.1 DATA AVAILABILITY

Hourly data are considered valid by the Permits if:

a) The instrument is serviced according to the requirements of the most recent version of the *British Columbia Field Sampling Manual* and the manufacturer's instructions, and
b) The data have been validated according to the BC ENV's Data Validation procedures described in the most recent version of the *British Columbia Field Sampling Manual*.

The Effluent Discharge Permit requires valid data for 90% of the hours in each calendar quarter, for continuously monitored parameters. Similarly, the Air Discharge Permit requires valid data for 90% of the hours in each calendar year. As the requirement of the Effluent Discharge Permit is more stringent, it will be used as the compliance standard.

To achieve the 90% per quarter compliance level, data gaps must not exceed approximately nine days cumulatively in a quarter. With Blackwater High as the primary climate station, the Blackwater Low station can be used as a redundant station to provide readings when the Blackwater High station is undergoing maintenance or upgrade. Sufficient concurrent data have been collected at the two stations to facilitate correlations of the two datasets, such that values at one station can be used to calculate expected values at the other. Accordingly, the permit is interpreted to require valid data (measured plus calculated for missing periods) for at least one station, for at least 90% of the hours in a calendar quarter. A summary of data availability, grouped by quarter, is presented in Table 2.1.

Table 2.1 Annual and Quarterly Total Data Availability

Parameter	BW High and Low Combined Daily Data Availability				
	Annual	Q1	Q2	Q3	Q4
Wind Speed	99.8%	99.7%	100%	100%	99.6%
Wind Direction	99.8%	99.7%	100%	100%	99.6%
Wind Direction Standard Deviation	99.8%	99.7%	100%	100%	99.6%
Air Temperature	99.9%	100%	100%	100%	99.6%
Precipitation	99.9%	100%	100%	100%	99.6%
Solar Radiation	99.9%	100%	100%	100%	99.6%
Rel. Humidity	99.9%	100%	100%	100%	99.6%

The permit requirement of data collected for more than 90% of the time in each quarter was met for all parameters.

2.2 AIR TEMPERATURE SUMMARY

The air temperatures recorded at the Mine in 2023 were compared to the long-term temperature series (41 years, 1980-2020) presented in the Hydrometeorology Report (KP, 2021). The long-term temperature series was synthesized based on correlations between data for the Mine stations and concurrent values for nearby ECCC long-term monitoring stations. Monthly and annual average temperatures for 2023 are shown in Table 2.2, along with the long-term historical range of values. At Blackwater High (primary station), the 2023 mean annual temperature (MAT) of 3.3°C was 1.3°C warmer than the long-term MAT of 2.0°C. At Blackwater Low, the 2023 MAT of 5.0°C was 1.8°C warmer than the long-term MAT of 3.2°C. The mean temperature for 2023 was higher than for any year in the 1980 to 2020 period.

Table 2.2 Mine Air Temperature in 2023 with Comparison to Long-term Estimates

Station / Parameter	Value	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual
Blackwater Low Air Temperature (°C)	Long-term Max	-2.7	-0.4	2.3	6.8	12.3	14.1	16.1	15.7	11.8	6.0	0.2	-2.0	4.8

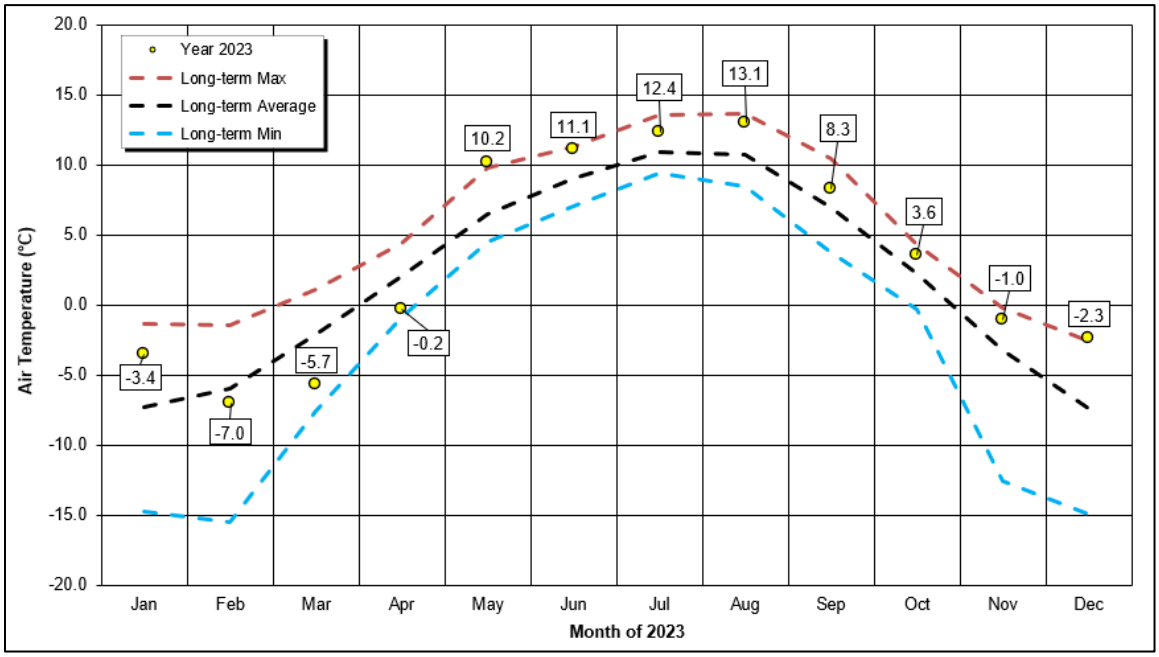
	Long-term Average	-7.3	-5.9	-2.1	2.1	6.5	9.1	11.0	10.7	7.0	2.3	-3.2	-7.3	2.0
	Year 2023	**-3.4**	**-7.0**	**-5.7**	**-0.2**	**10.2**	**11.1**	**12.4**	**13.1**	**8.3**	**3.6**	**-1.0**	**-2.3**	**3.3**
	Year 2023 Deviation from LT-Average	+3.8	-1.1	-3.6	-2.3	+3.8	+2.0	+1.4	+2.3	+1.2	+1.3	+2.2	+5.0	+1.3

Note(s):

1. Grey shaded values indicate months with more than 5 missing observations that required infilling based on correlations with values from the other station.
2. The Mine's primary monitoring station is BW High, with BW Low serving as a redundancy station.
3. Underlined 2023 values indicate a new maximum compared to the long-term record (1980-2020).

The 2023 monthly average air temperatures are visually compared with long-term average, maximum, and minimum average monthly temperature patterns on Figure 2.1.



Note(s):

1. Monthly Average Air Temperature measurements at Blackwater High station (elevation 1,470 m) are shown as yellow dots.
2. Long-term statistics are based on a 41-year synthetic record (1980-2020) for the Blackwater High station.

Figure 2.1 Monthly Average Air Temperatures at Blackwater High

During 2023, the climate transitioned from La Niña to El Niño conditions. During El Niño periods in the Pacific Northwest region where the Mine is located, conditions are usually warmer and dryer than during La Niña periods. In terms of natural hazards, La Niña conditions are usually associated with cold spells and flood events, while El Niño conditions are usually associated with heat waves and increased wildfire activity. The World Meteorological Organization (WMO) declared the onset of El Niño in early July, but the transition at site occurred a little earlier around spring 2023, with temperatures mostly below long-term averages in the first quarter of the year, and then rising to and staying above long-term averages for the remainder of the year.

2.3 PRECIPITATION SUMMARY

The precipitation records at the Mine in 2023 were compared to the long-term precipitation series (41 year, 1980-2020) presented in the Hydrometeorology Report (KP, 2021). The long-term precipitation series was synthesized by correlating Mine station data with nearby ECCC station data. Periods of missing 2023 data at Blackwater Low were estimated by adjusting concurrent Blackwater High data according to an orographic factor. Monthly and annual average precipitation for 2023 are shown in Table 2.3, along with the long-term historical ranges of values.

Table 2.3 Monthly and Annual Precipitation - 2023 and Long-term Estimates

Station / Parameter	Source	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual
Blackwater Low Total Precipitation (mm)	Long-term Max	128	98	62	70	83	155	156	134	90	146	122	79	657
	Long-term Min	11	5	1	4	7	15	11	2	7	6	12	7	345
	Long-term Average	41	28	24	28	38	59	56	46	44	54	42	37	495
	Year 2023	**34**	**34**	**24**	**28**	**14**	**27**	**72**	**39**	**13**	**20**	**24**	**32**	**361**
	Year 2023 as Percentage of LT-Average	83%	121%	100%	99%	36%	46%	129%	83%	30%	37%	58%	86%	73%
	% Precipitation as Snow	81%	74%	74%	52%	0%	0%	0%	0%	0%	27%	65%	87%	38%
Blackwater High (Primary) Total Precipitation (mm)	Long-term Max	164	106	65	79	100	177	178	153	103	175	120	101	779
	Long-term Min	14	6	2	4	8	17	12	9	10	18	15	10	408
	Long-term Average	51	35	30	33	44	68	64	52	51	65	56	47	595
	Year 2023	**46**	**73**	**29**	**33**	**19**	**45**	**91**	**32**	**23**	**31**	**51**	**38**	**512**
	Year 2023 as Percentage of LT-Average	90%	209%	97%	100%	44%	67%	143%	61%	46%	48%	91%	81%	86%
	% Precipitation as Snow	93%	100%	89%	70%	2%	6%	0%	0%	10%	23%	81%	89%	47%

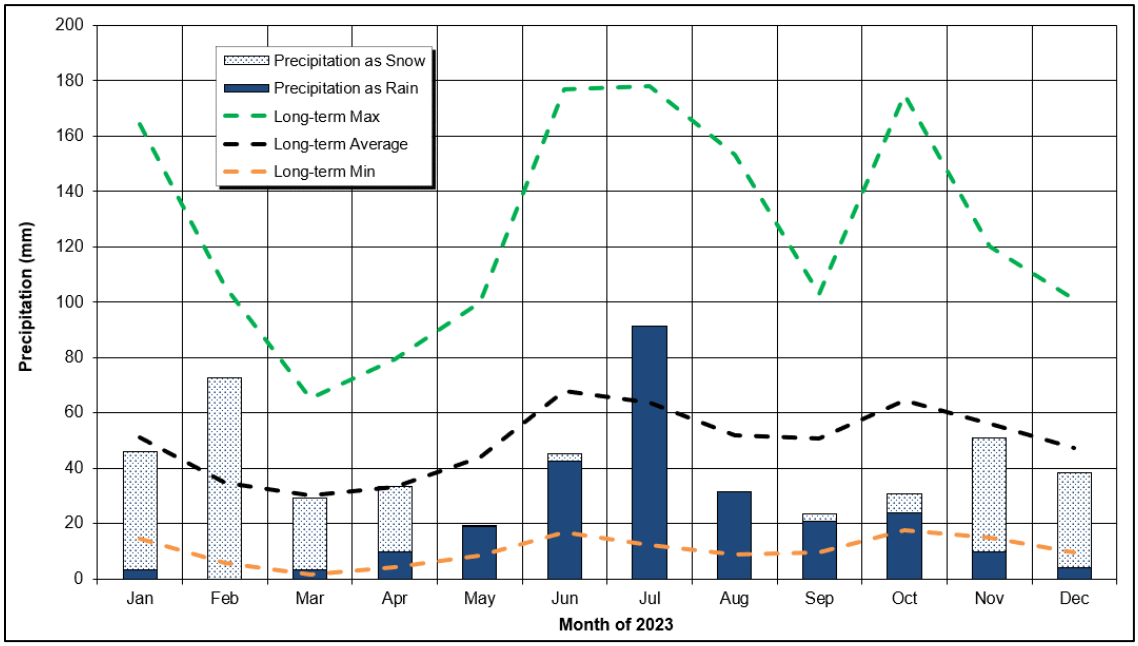
Note(s):

1. Grey shaded values indicate months with more than 5 missing observations. These values were estimated by orographically adjusting the concurrent values from the Blackwater High station.
2. The Mine's primary monitoring station is Blackwater High, with the Blackwater Low station serving as a back-up station.
3. % precipitation as snow is for 2023.

At Blackwater High, the 2023 annual precipitation of 512 mm was 86% of the long-term mean annual precipitation (MAP) of 595 mm. At Blackwater Low, the 2023 annual precipitation of 361 mm was 73% of the long-term MAP of 495 mm, though the relatively lower precipitation at this site may have been at least partially due to the estimation of missing data. About 47% of the annual precipitation 2023 fell as snow at Blackwater High and 38% of the annual precipitation 2023 fell as snow at Blackwater Low. Blackwater Low had a lower percentage occurring as snow due to its lower elevation and correspondingly warmer temperatures.

The 2023 annual precipitation was lower than average at both stations, ranking between the mean and 10-year dry values at Blackwater High and between the 20-year and 50-year dry values at Blackwater Low (Table 2.12 of KP 2021).

A comparison of the 2023 monthly precipitation at Blackwater High with the long-term monthly mean, maximum, and minimum values is shown on Figure 2.2. As discussed previously, regional climate conditions in 2023 transitioned from cold and wet La Niña conditions to hot and dry El Niño conditions. Consistent with this pattern, precipitation at the site was mostly at or above normal levels in January to April, and then, except for July, precipitation was below normal the rest of the year.



Note(s):

1. Precipitation measurements at Blackwater High station (elevation 1,470 m).
2. Long-term statistics are based on a 41-year synthetic record (1980-2020) for the Blackwater High station.

Figure 2.2 Mine Precipitation in 2023

2.3.1 EXTREME PRECIPITATION

The five highest 24-hour precipitation depths values recorded in 2023 at the Blackwater High station are presented in Table 2.4.

Table 2.4 Five Highest Precipitation Events in 2023

Date of High Precipitation Event	24-hour Precipitation (mm), Blackwater High
2023-07-16	23.02
2023-06-18	19.14
2023-07-24	16.74
2023-06-19	16.69
2023-03-24	16.36

These values are raw data values before the application of an under-catch factor. Precipitation gauges are subject to under-catch in windy conditions. The average wind speed recorded at Blackwater High on July 16, 2023 was 1.6 m/s, and the precipitation gauge at Blackwater High is equipped with an Alter-type windshield; as such, a catch efficiency of 95% is applicable, which translates to an under-catch factor of 1.05. Application of this factor to the maximum 24-hour precipitation recorded in 2023 at Blackwater High results in a value of 24.2 mm, which is less than the 2-year storm (32 mm/24-hour) estimated in the latest Project Hydrometeorological Report (KP, 2021).

2.4 SNOW SURVEY SUMMARY

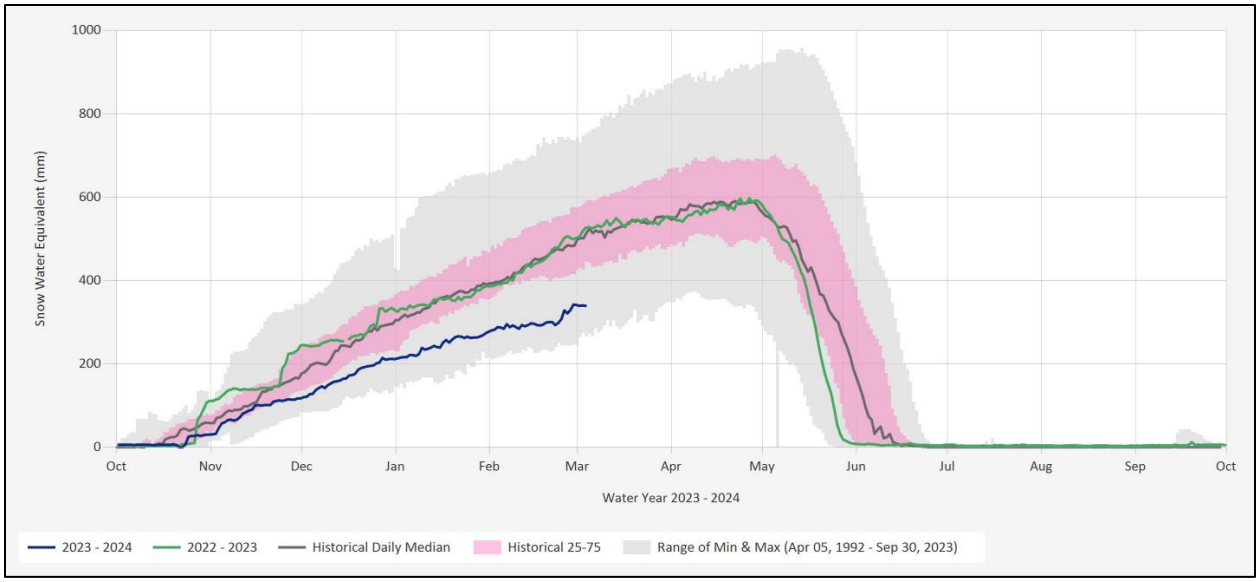
The manual snow surveys at the Mine followed the sampling schedule of the regional snow survey conducted by the BC government. Snow surveys were completed in early 2023, prior to the issuance of the EMA permit in May 2023 (PE 110652). In March and April, the transition to the major mine permits and associated regulatory changes led to uncertainties in scope approval and the temporary interruption of site visits. Field work resumed in May 2023 after the issuance of the EMA permit. By this time, the snowpack had melted at the survey stations. Consequently, no snow survey data are available for April 1, May 1 and June 1 of 2023.

The results of the 2023 manual snow surveys at the Mine are summarized in Table 2.5.

Table 2.5 2023 Snow Course Survey Measurements

Snow Course	Date	Avg. Snow Depth (cm)	Avg. Snow Water Equivalent (cm)	Avg. Snow Density (%)
SS1	2023-01-04	59	11.6	20
	2023-02-23	97	20.0	21
SS2	2023-01-04	31	5.6	18
	2023-03-01	50	9.2	18
SS3	2023-01-05	39	6.2	16
	2023-03-01	46	10.4	23

Snow water equivalent (SWE) data from the nearby Mount Wells snow pillow station (1B01P) are presented on Figure 2.3 (BC RFC, 2023).



Note(s):

1. Data Source: Mount Wells Automatic Snow Pillow Station 1B01P (BC RFC, 2024).
2. Water year (WY) starts in October of the previous year and ends in September. Snowpack conditions in WY 2023 (Oct 2022 – Sep 2023) were normal, while conditions during the first 4 months of WY2024 (Oct-Dec 2023) were below average.

Figure 2.3 Mount Wells Snow Water Equivalent Results

The regional observations show that snowpack conditions during the winter of 2022/2023 (October 2022 to May 2023) were normal, while during the current winter of 2023/2024 (October 2023 to March 2024) snowpack levels have been lower than normal.

It should be noted that the area around the high-elevation snow survey station SS1 was fully logged for mining operations by April 13, 2023, resulting in the need to relocate this station. A new high-elevation snow survey station will be established in Q1 2024 at a suitable location approved by a Qualified Professional (QP).

3.0 CONTINUATION AND IMPROVEMENT

Avison and KP will continue to service the Blackwater High and Blackwater Low climate stations in accordance with the *Climatology Station Operational and Quality Assurance Plan* (KP, 2023).

In August 2023, the two climate stations were each upgraded with a telemetry modem, which added real-time weather monitoring capabilities for the Mine. This upgrade has significantly improved response times to sensor malfunction and repair. Additionally, accessing real-time weather data via an interactive dashboard facilitates operation and management planning for the Mine.

Blackwater Gold Project

Country Foods Monitoring Plan: Environmental Assessment Certificate Condition 41 Annual Report 2023

As required by the Blackwater Gold Mine Environmental Assessment Certificate Condition 41, the CFMP was prepared and implemented by qualified environmental professionals (QEPs), including those shown below. A QEP is a person who has training, experience, and expertise in a discipline relevant to the field of practice set out in the condition, is registered with a professional organization enabled under an Act who must follow a code of ethics issued by the professional organization, perform her or his duties in the public interest, and can be subject to disciplinary action by the organization.

ACKNOWLEDGEMENTS

This report was prepared by Entia Environmental Consultants Ltd (Entia), under a sub-contract with ERM Consultants Canada Ltd. (ERM), on behalf of BW Gold Ltd. (BW Gold). This report was authored by Dr. Annette Muttray with senior technical review by Dr. Lesley Shelley. Statistical analyses were conducted by Dr. Arianne Albert, Sawyer McFadden, Alexandre Baud, and Joanna Zhao of ERM. Carrie Strangway of ERM provided statistical summaries of water quality data. Review was provided by Patty Vadnais and Stuart Van Bibber of ERM. ERM also provided GIS, Graphics, and Publishing support services.

EXECUTIVE SUMMARY

Section 41(i)(v) of the Environmental Assessment Certificate (EAC) requires a plain-language executive summary that summarizes the data, results, and conclusions of the Country Foods Monitoring Plan (CFMP) be provided. Rather than providing a fully separate report, this Executive Summary section provides the required plain language summary of the 2023 CFMP sampling program, results, and conclusions.

CONTEXT AND SITE ACTIVITIES IN 2023

Section 41 of the EAC for the Blackwater Mine (the Mine) requires a CFMP, including the sampling of air, surface water, fish tissue, soil, plant and berry tissue, and small mammals. The purpose of the CFMP is to:

- determine the effects of the Mine on the aquatic and terrestrial environments with respect to metal concentrations in country foods; and
- to confirm the predictions made in the human health risk assessment (HHRA) for the optimized Project.

If unexpected effects of the Project are found, the CFMP includes an adaptive management framework to identify the need for additional mitigation measures to reduce or eliminate mine-related effects.

The Mine initiated limited Early Works and other construction activities at the mine site in October 2022, which continued into 2023. Construction activities included clearing, grubbing ditching, site levelling at the Plant Site location, installation of sediment and erosion controls, and construction of ditches, diversions, and a sediment control pond. Six clear span bridges within the mine site were also replaced in 2023 with suitable construction equipment rated structures.

BW Gold received an amended *Environmental Management Act* (EMA) Permit PE-110652 and PE-110650 in May 2023, authorizing discharge of effluent to surface water and groundwater from the Blackwater mine site and discharge of air contaminants to the atmosphere from the mine, respectively. In 2023, there were no effluent discharges from the Mine to surface water, however, a permitted discharge to ground occurred to the Rapid Infiltration Basin (RIB) during the 2023 monitoring period.

BW Gold has a permitted diesel-fired putrescible waste incinerator (PE-106530), which is located near the exploration camp. The incinerator had a trial run in 2023 to ensure that it is in good working condition. However, in 2023 the incinerator was not used as a part of the Waste Management Plan at the Mine. No point source emissions to air occurred in 2023 as construction of the mine site progressed.

Activities in 2023 that could have resulted in emissions of fugitive dust (non-point source emissions) to air were the following:

- Land clearing and earthworks for the construction camp and plant site;
- Construction and use of unpaved access and mine roads;
- Material handling/re-handling at aggregate and topsoil stockpiles;

- Parking lot and road grading;
- Construction of water management structures (e.g., diversion channels);
- Aggregate extraction from borrow pits;
- Borrow and aggregate crushing and screening; and
- Concrete Batch Plants.

In July 2023, a lightning-caused wildfire (Davidson Creek wildfire) started in areas adjacent to the mine site, which affected all field sampling programs including the CFMP. Although access to the mine site was allowed again in late July, the wildfire affected field sampling programs under the CFMP by preventing safe access to some sites (e.g., due to presence of danger trees) or burning of plants and berries that would normally be sampled at a given site. Due to access limitations, field sampling programs were carried out later in the field season (e.g., late August into September) in 2023 compared to previous years.

SAMPLING UNDER THE CFMP IN 2023

Sampling for metal concentrations in 2023 under the CFMP included the following:

- Air quality: dustfall samples (as a surrogate for metals associated with inhalable particulate matter in air) were collected at four sites close to the mine site (near-field sites) and four control sites away from the mine site. These sites are also sampling sites for soil, plants, and berries.
- Soil: soil samples were collected at a total of 42 sites (36 regular sampling sites and 6 new sampling sites). Three sites that are normally part of the CFMP sampling program could not be sampled in 2023 due to the fire that occurred in July 2023.
- Plants and berries: a total of 40 willow samples, 26 sedge samples, and 14 Labrador tea samples were collected, while only 2 berry samples were collected (berries were not available for sampling due to a hot, dry summer). Three sites that are normally part of the CFMP sampling program could not be sampled in 2023 due to the fire that occurred in July 2023. Plant and berry samples were collected at the same sites and at the same time as the soil samples.
- Small mammals: a total of 32 deer mice and 25 red-backed voles were sampled at the same sites where dustfall samples were collected (4 sites near the mine site, 4 control sites), with liver and carcass (rest of the body minus the liver) sent to the lab for tissue metal analysis.
- Surface water: a total of 160 water samples were collected at control sites (locations either upstream of the mine site or located in an adjacent watershed, outside of the influence of the mine site) and 378 water samples were collected at impact site (locations downstream or downgradient of the mine site).
- Fish tissue: a total of 116 fish tissue samples were collected, with 59 sampled from potential impact sites and 57 sampled from control sites.

RESULTS OF CFMP SAMPLING IN 2023

Results of sampling in 2023 are summarized for metals in air (dustfall), soil, plants, berries, surface water, and fish tissue in the following paragraphs, in the context of the adaptive management framework for the CFMP.

The adaptive management framework in the CFMP identifies triggers (called numeric performance metrics, NPMs) to define no, low, medium, and high action levels based on comparison of the sampling results with the triggers defined for metal in air, soil, plants and berries, surface water, and fish tissue. Each action level has different "management responses" that identify actions that are needed to identify and address causes of unexpected Mine-related changes. If the trigger levels are not exceeded, the action level is defined as "none" and no changes to mitigation are needed as mitigation measures are working in the way they were expected to perform. There are three types of triggers (NPMs):

- Guideline NPMs: guidelines defined by regulatory agencies (such as Health Canada or BC Ministry of Environment and Climate Change Strategy) that are protective of human health for air, soil, plants, berries, surface water, and fish.
- Baseline NPMs: concentrations defined based on baseline datasets for air, soil, plants, berries, surface water, and fish.
- Predicted NPMs: concentrations defined based on predictive modelling for the Mine for air, soil, plants, berries, surface water, and fish.

For metals in air (based on dustfall metal results), average concentrations of all parameters in 2023 were lower than the air quality Guideline NPMs. However, manganese and lead concentrations were found to be higher than the Baseline and Predicted NPMs. Statistical analysis found that changes in manganese concentrations were significantly higher at control sites (away from the mine site) than at impact sites near the mine site and changes in lead concentrations were not significantly different. Based on results of 2023 monitoring, the trigger level in the adaptive management framework for air quality is "Low". However, no specific action is recommended based on 2023 dustfall monitoring results because concentrations higher than the Predicted NPMs are likely an artefact of the methods used to estimate metal concentrations in predictive modelling for air and because changes in concentration of manganese was higher at control sites, not impact sites, which is not a Mine effect.

For soil, average concentrations of metals were lower than Baseline, Predicted, and Guideline NPMs for soil. Similarly for plants, average concentrations of metals were lower than Baseline, Predicted, and Guideline NPMs for plants.

For berries, interpretation of the results is difficult as only two samples were obtained in 2023 because there were not many berries available for sampling (hot, dry summer). Other than arsenic in one berry sample, all metals were below the Baseline, Predicted, and Guideline NPMs for berries. The arsenic concentration in one huckleberry sample that was higher than the NPMs appears to be an outlier (an unusual result), as it is substantially higher than any arsenic concentration measured previously and significant changes in arsenic concentrations were not found in air (dustfall), soil, or plants. Thus, based on 2023 monitoring results, the trigger level in the adaptive management framework for soil, plants, and berries is "None".

There were no Mine discharges to surface water in 2023. Average concentrations of metals in surface water were below Guideline NPMs for water quality. Except for iron, average concentrations of metals were below the Baseline and Predicted NPMs. Based on statistical analysis, the change in iron concentrations was not significant and changes in the mean concentration were likely driven by a few samples with high concentrations and are not indicative of Mine-related changes to water quality. Assignment to a trigger level for water quality in the adaptive management was not completed because it is based on monitoring results from two consecutive years of sampling that indicate an exceedance of the Baseline or Predicted NPMs. No immediate action is recommended based on results of 2023 monitoring in surface water because:

- There were no Mine discharges to surface water in 2023, so changes in concentrations of metals are not likely to be an effect of the Mine;
- Iron concentrations were below all NPMs in 2022;
- Iron was the only parameter in surface water with average concentrations higher than Baseline and Predicted NPMs in 2023;
- The change in iron concentration was not significant in 2023; and
- Average iron concentrations measured in surface water in 2023 are 25 times lower than the drinking water quality guideline.

For fish tissue, average concentrations were lower than Baseline, Predicted, and CF Guideline NPMs for fish tissue. Thus, based on 2023 monitoring results, the trigger level in the adaptive management framework for fish tissue is “None”.

Sampling of small mammals in 2023 was completed to provide baseline or pre-Operations phase data on tissue concentrations of COPCs, as a foundation for future monitoring. There are no human health-based NPMs based on rodent tissue sampling.

CONCLUSION

Based on the results of the 2023 monitoring programs under the CFMP, no adjustments to current mitigation measures are required at this time to protect human health. The results of the 2023 monitoring program are in line with what would be expected, given the Early Works and other construction activities in 2023, as there were no Mine discharges of effluent to surface water.

Sampling under the CFMP or linked monitoring programs is proposed for 2024, including the following:

- Air quality for criteria air contaminants, as described in the Air Quality and Fugitive Dust Management Plan;
- Fish tissue sampling, as described in the Aquatic Effects Monitoring Plan; and
- Surface water quality, as described in the Aquatic Effects Monitoring Plan.

Mine, the	Blackwater Mine
Mtpa	Million tonnes per annum
NPM	numeric performance metrics
PASS	Passive air sampling system
PM	Particulate matter
Project, the	Blackwater Gold Project
Proponent	BW Gold LTD.
QA/QC	Quality assurance/quality control
RIB	Rapid Infiltration Basin
RPD	Relative percent difference
SQ	Soil Quality
SWQ	Surface water quality
t/d	Tonnes per day
TSF	Tailings storage facility
UCLM	Upper confidence limit of the mean
UFN	Ulkatcho First Nation

1. INTRODUCTION

1.1 BACKGROUND

The Blackwater Mine (the Mine) is an open pit gold and silver mine currently under construction, located in central British Columbia (BC) 160 kilometres (km) southwest of Prince George, BC. The Mine is located within the traditional territories of Lhoosk'uz Dené Nation (LDN), Ulkatcho First Nation (UFN), Skin Tyee Nation and Tsilhqot'in Nation. The Kluskus and Kluskus-Ootsa Forest Service Roads (FSR) and Mine transmission line cross the traditional territories of Nadleh Whut'en First Nation, Saik'uz First Nation, and Stellat'en First Nation (collectively, the Carrier Sekani First Nations) as well as the traditional territories of the Nazko First Nation, Nee-Tahi-Buhn Band, Cheslatta Carrier Nation, and Yekooche First Nation.

The Mine will have a life of mine of 23 years and will ramp up production in three phases: Year 1-5: 15,000 tonnes/day (t/d) (5.5 Million tonnes per annum [Mtpa]); Year 6-10: 33,000 t/d (12 Mtpa); and Year 11-23: 55,000 t/d (20 Mtpa). Ore will be processed in a plant by a combined gravity circuit and whole ore cyanide leach to recover gold and silver. The gold and silver will be recovered into a gold-silver doré product. Mine layout at the end of the Operations phase is found on Figure 1.1-2.

The Mine received Environmental Assessment Certificate #M19-01 (EAC) on June 21, 2019 under the 2002 *Environmental Assessment Act* and a Decision Statement (DS) on April 15, 2019 under the *Canadian Environmental Assessment Act, 2012* approving the Blackwater Project, with conditions.

The conditions include several environmental monitoring and management programs with the goal of protecting the environment and human health. The Country Foods Monitoring Program (CFMP; ERM 2022) is one such program and addresses all or some aspects of the following provincial EAC and federal DS conditions:

- in the EAC:
  - Condition 41: Country Foods Monitoring Plan;
  - Condition 2: Plan Development;
  - Condition 3: Adaptive Management; and
  - Condition 4: Consultation.
- in the DS:
  - Conditions 6.5, 6.11, 6.12 and 6.15: Health and Socio-economic Conditions and Current Use of Lands and Resources for Traditional Purposes;
  - Conditions 2.3 and 2.4: Consultation;
  - Conditions 2.5, 2.6, 2.7, 2.8, 2.9, and 2.10: Follow-up and Adaptive Management; and
  - Conditions 2.11, 2.12, and 2.13: Annual Reporting.

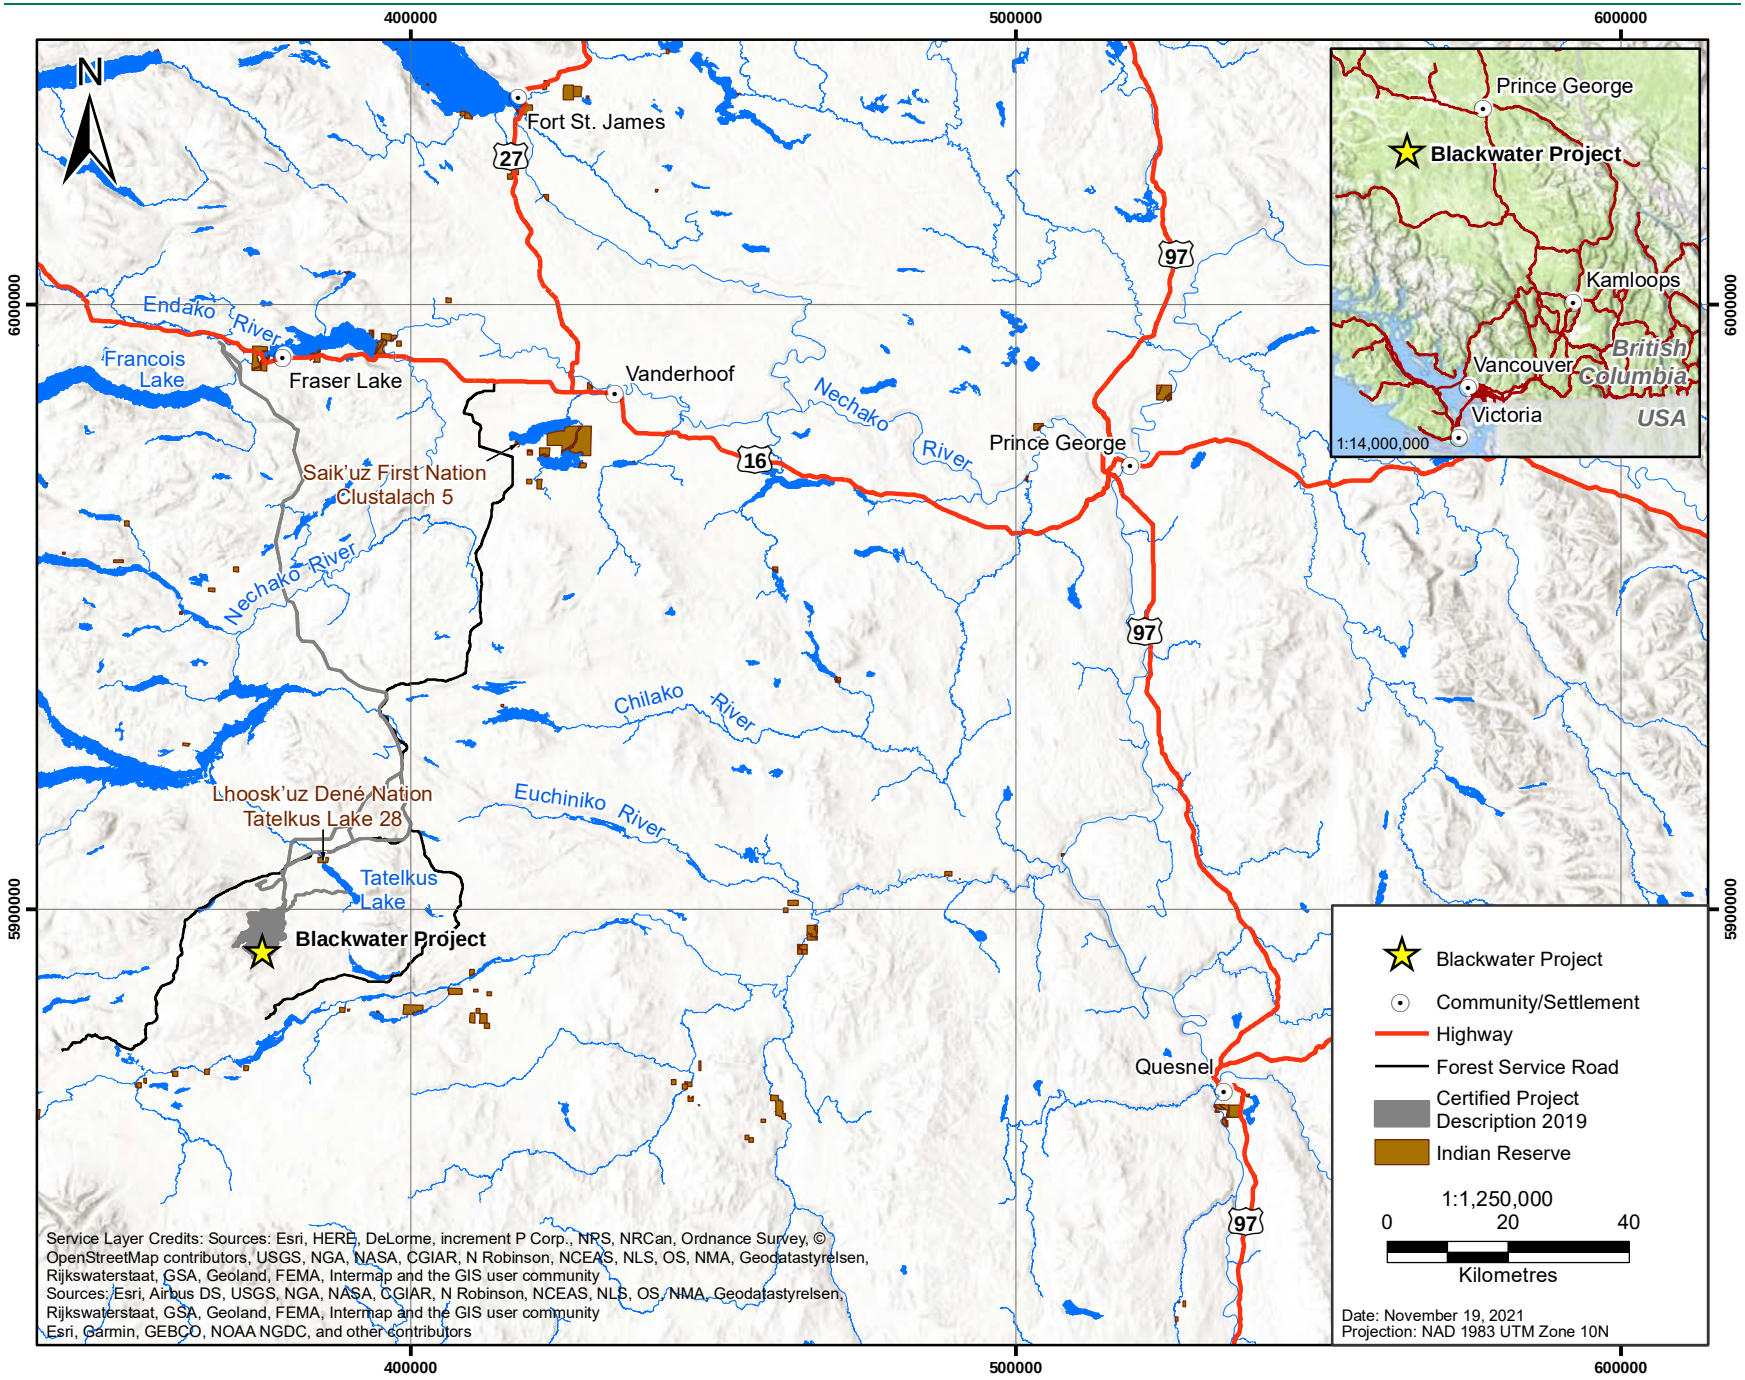

Figure 1.1-1: The Blackwater Gold Project Location

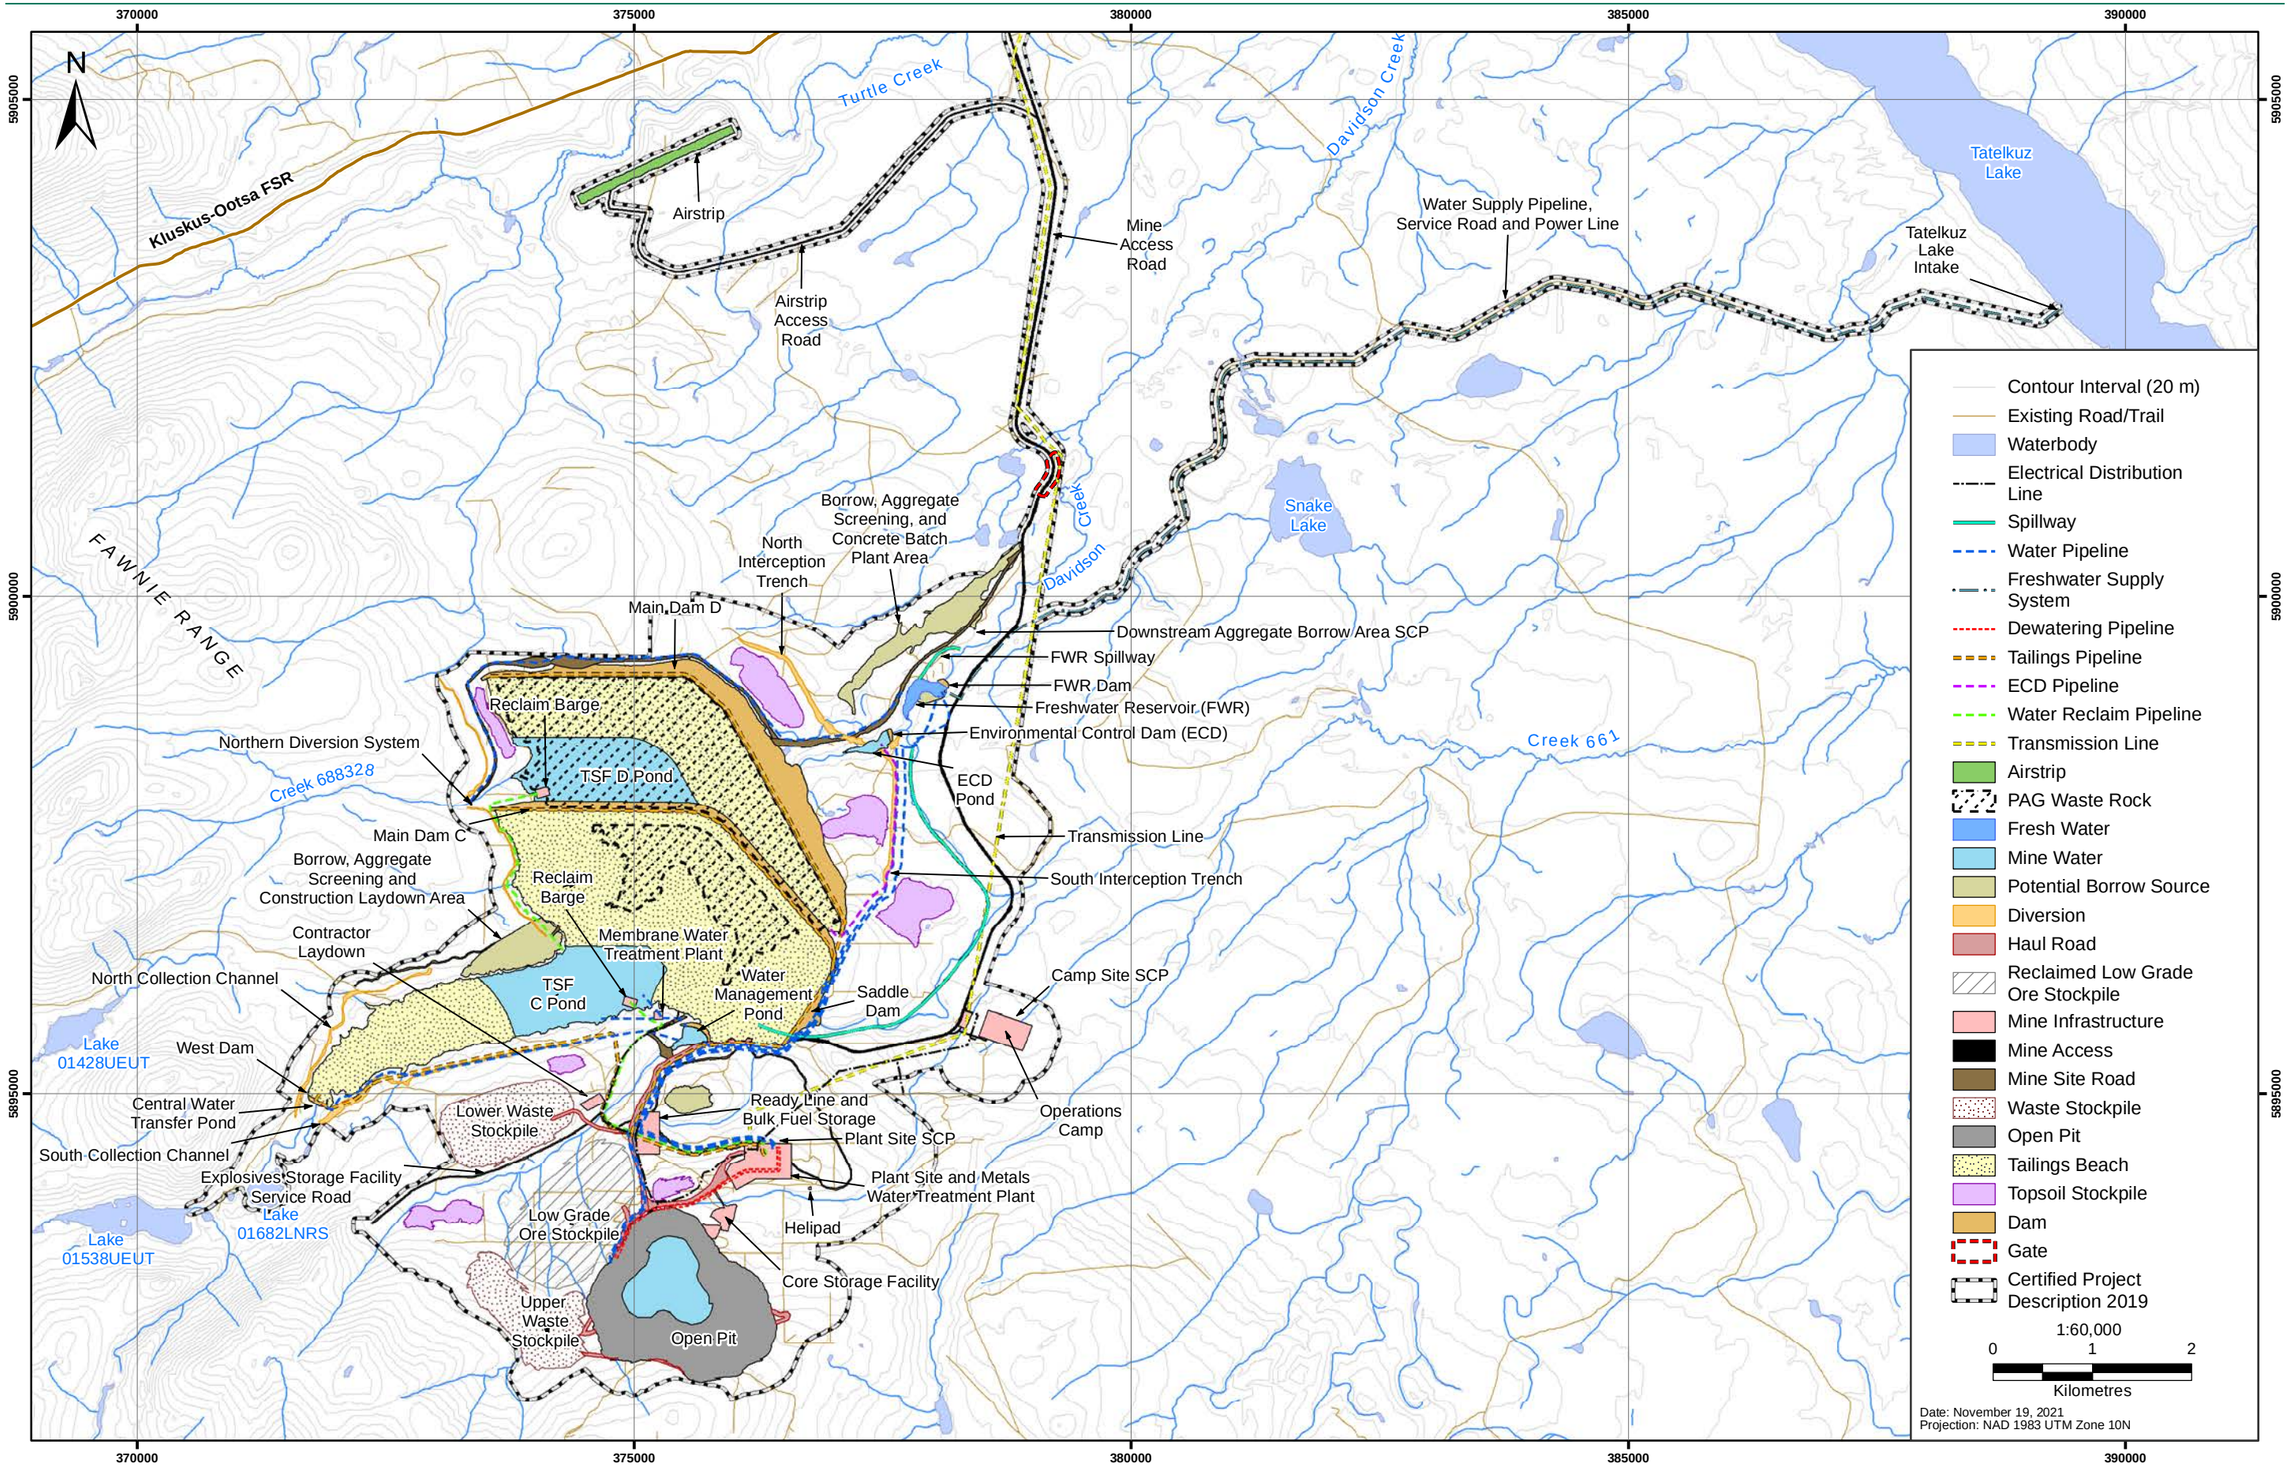

Figure 1.1-2: The Blackwater Gold Project Mine Plan

Baseline data collection and monitoring programs were conducted up until the end of September 2023 in support of the CFMP, including baseline sampling of water quality, air quality (dustfall and dust metals), soil, plant and berry tissues, and fish tissues. Results of the baseline monitoring programs are provided in other reports including the following:

- 2021-2022 Cumulative Dustfall, Soil, and Plant Metal Concentration Baseline Report (ERM 2023b);
- 2023 Aquatic Effects Monitoring Program Interpretive Report (ERM 2024);
- Chapter 2 of the Joint Application for *Mines Act*/*Environmental Management Act* permits (BW Gold 2022b) for Baseline air quality data for criteria air contaminants (CACs); and
- 2022 Air Quality and Fugitive Dust Management Annual Report (BW Gold 2023).

This report is the second Annual Report under the CFMP. The first Annual Report was submitted on March 31, 2023 for the monitoring period of October 1 to December 31, 2022 (ERM 2022). Reporting was triggered under Condition 5 of the EAC, which sets out timelines for reporting requirements. BW Gold must submit a report to the attention of the EAO and Indigenous groups on the status of compliance with EAC #M19-01 before March 31 in each year after the start of Construction. Since BW Gold began limited Early Works construction activities at the mine site in October 2022, the second annual report under the CFMP for the period from January 1, 2023, to December 31, 2023, is required to be submitted by March 31, 2024.

Of the sampling described under the CFMP (see Section 4 of the CFMP), surface water quality, air particulate matter (dustfall), soil, vegetation (plant and berry) tissue, small mammal tissue, and fish tissue sampling was conducted during the monitoring period. This CFMP Annual Report presents results of monitoring these environmental media and tissues for the 2023 monitoring period.

1.2 MINE ACTIVITIES COMPLETED IN 2023

The Mine initiated limited Early Works construction activities (including clearing, grubbing ditching, site levelling at the Plant Site location, installation of sediment and erosion controls, and construction of ditches, diversions, and a sediment control pond) at the mine site in October 2022. During the period from October 1, 2022 to December 31, 2022, only surface water quality samples were collected and results were reported in the *Country Foods Monitoring Plan: Environmental Assessment Certificate Condition 41 Annual Report 2022* (ERM 2023d).

From January to December of 2023, the Mine continued with Early Works construction activities and other construction. Table 1.2-1 provides an overview of construction activities that were carried out from January 1, 2023 to the end of December 2023 at the Mine. Other construction activities (e.g., major works, transmission line construction in late 2023, site upgrades and improvements) are detailed in the Annual Reclamation Report (BW Gold, 2024).

BW Gold received an amended EMA Permit PE-110652 and PE-110650 in May, 2023, authorizing discharge of effluent to surface water and groundwater from the Blackwater mine site and discharge of air contaminants to the atmosphere from the mine respectively. There were no authorized effluent discharges from the Mine to surface water, however, a discharge to ground occurred from the Rapid Infiltration Basin (RIB) during the 2023 monitoring period.

TABLE 1.2-1 OVERVIEW OF EARLY WORKS COMPONENTS AND ACTIVITIES AND ACTIVITIES COMPLETED BETWEEN JANUARY 1 AND DECEMBER 31, 2023

<table>
<tr><th>Component/ Activity</th><th>Description</th><th>Activities Completed January 1 to December 31, 2023</th></tr>
<tr><td>Mine Access Road</td><td>• Kluskus-Ootsa Forest Service Road (FSR) km 124.5 to Plant Site
• Kluskus-Ootsa FSR to mine site boundary to be permitted under Special Use Permit
• Mine site boundary to mine site terminus to be permitted under Mines Act
• 16 km single lane
• Balanced cut and fill; no bedrock excavation/blasting
• Located on mineral tenure held by BW Gold
• Approximately 100 ha of disturbance; partially cleared</td><td>• No work completed.</td></tr>
<tr><td>Mine Access Road Bridges</td><td><table>
<tr><th>Bridge</th><th>Length (m)</th><th>Location (from the Kluskus-Ootsa FSR)</th><th>Description</th></tr>

</table></td><td>• No work completed</td></tr>
<tr><td>Mine Site Roads (includes mine haul roads, mine site service roads, exploration road upgrade within mine site)</td><td>• Clearing, grubbing and construction of roads to proposed Early Works on mine site
• Approximately 178.9 ha of disturbance
• Estimated 7 clear-span bridges for fish-stream crossings
• No bedrock excavation/blasting</td><td>• 37 Ha of logging/clearing completed in 2023.
• 6 clear span bridges replaced with suitable construction equipment rated structures (11.6 km and 12.9 km on C-Trail, A-Trail Mine Creek Crossing, K-Trail Bridge, and 2 bridges on M-Trail.</td></tr>
</table>

Component/ Activity	Description	Activities Completed January 1 to December 31, 2023
Borrow Sources	Clearing of trees for two borrow sources: • Within footprint of the future Environmental Control Dam area – approximately 13.7 ha of disturbance • Southern borrow in TSF – approximately 7.5 ha of disturbance	• 15Ha logged/cleared in borrow area south of TSF.
Tailings Storage Facility	Clearing of trees in 3 areas: • TSF Site C starter dam footprint: 109.8 ha • Aggregate screening site: 9.3 ha	• 110 Ha logged and cleared in 2023 for TSF. 24.7 Ha logged and cleared for the aggregate screening site.
Water Management Structures	• Clearing of trees along water diversion channel route northeast of Site C starter dam: 47.1 ha of surface disturbance	• WMP – 10.7 Ha logged and cleared
Ore Stockpile Sites	• Adjacent to Open Pit and Plant Site • Clearing of trees • Future LGO stockpile base 4.5 ha of surface disturbance • Future high-grade ore stockpile base 3.1 ha of surface disturbance	• No work completed.
Open Pit and Overburden Dump Site	• Clearing of trees • Open pit stripping of overburden on 20.5 ha • Stockpile pit stripping overburden on 11.1 ha of surface disturbance	• No work completed
Water Supply	• Groundwater well east of camp provides sufficient water for portable water treatment plant for potable water • If necessary, a second groundwater well will be drilled in this location • No additional site clearing required	• TW13-01 pipeline to camp
Ancillary Building Sites	Clearing at multiple sites: • Explosives magazine site: 3.1 ha of surface disturbance • Truck shop and mine offices: 18.6 ha of surface disturbance • Operational camp area: 33.9 ha of surface disturbance • Existing 250-person camp: 0 ha	• Explosives Mag – complete logging/clearing 5.4 Ha • Truck shop and mine offices – complete 6 Ha • Ops camp – no work completed.
Plant Site	Clearing, grubbing, site levelling, soil, overburden salvage. No bedrock excavation/blasting: • Plant Site: 24.4 ha of surface disturbance	• Work completed – site was logged cleared and partially levelled in 2022, remaining work was completed in 2023. 29 Ha.

BW Gold has a permitted diesel-fired putrescible waste incinerator (EMA Authorization #106530), which is located near the exploration camp. The incinerator had a trial run in 2023 to ensure that it is in good working condition. In 2023, the incinerator was not utilized as a part of the Waste Management Plan at the BW Gold Mine. No new point source emissions to air occurred during this time as construction of the mine site progressed (Artemis Gold 2024). Activities in 2023 that could have resulted in emissions of fugitive dust (non-point source emissions) were the following:

- Land clearing and earthworks for the construction camp and plant site;
- Construction and use of unpaved access and mine roads;
- Material handling/re-handling at aggregate and topsoil stockpiles;
- Parking lot and road grading;
- Construction of water management structures (e.g., diversion channels);
- Aggregate extraction from borrow pits;
- Borrow and aggregate crushing and screening; and
- Concrete Batch Plants.

1.3 WILDFIRE ACTIVITY AND SAMPLING SITE ACCESS

In 2023, the Davidson Creek fire (July Wildfire; Fire Number: G41493; BC Wildfire Service) was discovered west of the Mine on July 10, 2023, impacting various sampling sites. The Blackwater camp was evacuated by provincial order due to an uncontrolled wildfire in the area later that day. The site was closed for all non-essential employees and activities were resumed in a staged approach starting July 24, with construction resuming August 3. With respect to the Mine footprint, the fire extended from approximately kilometre marker (KM)8–KM16 along the Blackwater Access Road. Some building structures were lost to the fire, including offices located directly across from the main facilities. The fire primarily affected standing timber and understory vegetation along smaller Mine roads on the western area of the mine site. The mine experienced smoke from the Davidson Creek fire and regional fires throughout the summer months.

The wildfire burnt soil, plant, and berry sampling sites that had previously been sampled during baseline sampling programs under the CFMP, specifically:

- Three (CFMP-SV-003, -015, and -031) out of the original 39 soil and vegetation sampling sites were not accessible in 2023 due to safety concerns or other access limitations.
    - Site CFMP-SV-003 was overgrown and had 1.5 km of burnt forest on either side of the overgrown access road that had not been cleared for access (Photo 1.3-1).
    - Mid-field site CFMP-SV-015 had grown in and was not accessible by helicopter (no safe landing site) or by road. Sites CFMP-SV-003 and -015 were, therefore, not sampled.
    - Site CFMP-SV-031 was too dangerous to access due to effects from the fire (e.g., unstable danger trees) and was not sampled.
- Site CFMP-SV-004 was cleared by danger tree assessors and was accessible for soil and vegetation sampling, although vegetation had largely been burnt except for sedges (Photo 1.3-2).

Photo 1.3-1 Overgrown and burnt road to site CFMP-SV-003. Site was not accessible for sampling.

Photo 1.3-2 Site CFMP-SV-004 and view to south.

2. OVERVIEW OF THE CFMP

2.1 OBJECTIVES AND STRUCTURE OF THE ANNUAL REPORT

People may be exposed to contaminants of potential concern (COPCs) through inhalation of gases or particulates in air or ingestion of surface water, soil (incidental), or country foods such as plants and berries, fish, mammals, or birds. As a result of mining, mineral processing, or related activities, changes in concentrations of COPCs in environmental media, like surface water or soil, can influence the concentrations of the COPCs in plants, berries, fish, mammals, or birds (from uptake of COPCs through ingestion of environmental media or food) that may then be eaten by people as country foods. If concentrations or exposures are high enough, there is the potential for human health to be affected by exposure to the COPCs in environmental media or country foods.

COPCs were identified in the Conceptual Site Model (CSM; Entia 2022a) and the Human Health Risk Assessment (HHRA; Entia 2022b) and are metals, as defined in Section 3, Table 3-1, of the CFMP (ERM 2022). Criteria air contaminants (including particulate matter PM_{10} and $PM_{2.5}$, SO_2, NO_2) are not COPCs based on the results of the CSM (Entia 2022a) and the HHRA (Entia 2022b) and thus will not be included in the reporting under the CFMP, but are reported under the Air Quality and Fugitive Dust Management Plan (AQDMP; ERM 2023a).

No adverse effects to Indigenous or non-Indigenous health due to development of the Project were identified in the environmental assessment. The purpose of the CFMP Annual Report is to identify whether there have been changes in COPC concentrations in air, surface water, soil, and country foods as a result of the Mine that weren't predicted and whether these changes pose potential risk to people. As stated in the federal DS, objectives of the CFMP over the life of the mine are:

- "*to verify the accuracy of the environmental assessment as it pertains to adverse environmental effects of the Designated Project on the health of Indigenous Peoples caused by changes in concentrations of contaminants of potential concern in water, soil, vegetation and wildlife, including fish*" (Condition 6.11 of the Decision Statement). No adverse effects to Indigenous or non-Indigenous health were identified in the environmental assessment, so the CFMP is intended to confirm that assessment.
- to identify "*levels of environmental change relative to baseline conditions that would require the Proponent to implement modified or additional mitigation measure(s)*" (Condition 2.5.4 of the Decision Statement).

As such, annual reports will be submitted under the CFMP with the objectives:

- to determine the short- and long-term effects of the Project on the aquatic and terrestrial environments with respect to the quality of country foods;
- to confirm the quantitative predictions made in the HHRA updated for the optimized Project (Entia 2022b), submitted as part of the provincial Joint *Mines Act*/*Environmental Management Act* permits application;
- to assess the efficacy of mitigation measures that are used to minimize the effects of Project-related activities on the aquatic and terrestrial environments and country foods; and
- to identify the need for additional mitigation measures to reduce or eliminate mine-related effects.

This second CFMP Annual Report consists of the following sections:

- Section 1 – Introduction: includes background information and Mine activities during the reporting year.
- Section 2 – Overview of the CFMP: a description of the CFMP objectives, monitoring framework, and linkages to other management and monitoring plans.
- Section 3 – Sampling under the CFMP: summary of environmental or biological media sampled in the reporting year and any deviations or modification to the sampling methods or frequencies identified in the CFMP.
- Section 4 – Data analysis and interpretation: presentation of results of monitoring conducted in the CFMP study area during the reporting year, including statistical summaries and comparison to benchmarks, with interpretation of the results.
- Section 5 – Adaptive management and action level: an overview of the CFMP trigger response framework and identification of the action levels based on monitoring results for the reporting year, including identification of any recommended changes to monitoring or mitigation measures.
- Section 6 – Planned CFMP sampling program for 2024.
- Section 7 - Summary and recommendations: summary of results, recommendations, and any follow up actions.

Additional supporting information is included in the following appendices:

- Appendix A: Raw data for 2023 Construction monitoring period;
- Appendix B: Conversion tables of COPC concentrations in dustfall to COPC concentrations in $PM_{10;}$
- Appendix C: Statistical comparisons of COPC concentrations in environmental media;
- Appendix D: Summary statistics for COPC concentrations in individual plant species;
- Appendix E: Figures showing results of monitoring;
- Appendix F: Power analysis for small mammal tissue sampling; and
- Appendix G: Results for relative percent difference calculations.

2.2 FRAMEWORK FOR THE CFMP

The CFMP is one of numerous monitoring and management plans and programs for the Mine that use an adaptive approach to identifying, understanding, and reducing the magnitude, frequency, and extent of potential effects of Mine -related activities on the environment and human health.

The overall framework for monitoring, evaluating, and adaptively managing potential effects from the Mine to human health is presented in Figure 2.2-1. This adaptive management framework has been incorporated into the CFMP and serves as an early warning system for identifying and addressing potential effects before they reach levels of concern for human health.

FIGURE 2.2-1 ADAPTIVE MANAGEMENT FRAMEWORK

The components of the adaptive management framework are:

Plan: The CFMP study design considered the requirements for the CFMP to meet EAC Conditions 3 and 41 and DS requirements 2.5 to 2.10. BW Gold has engaged and will continue to engage with Indigenous groups and relevant federal and provincial authorities on these measures and programs.

Do: Implement the mitigation measures as described in the mitigation and management plans for the Mine.

Monitor: The CFMP includes monitoring programs to determine if, after mitigations and management has been applied, Mine-related effects to the aquatic or terrestrial environments occur.

Adjust: Quantitative human health-specific trigger (also called numeric performance metric; NPM) concentrations (ERM 2023f) are used to identify the level of Mine-related change relative to predicted conditions, baseline conditions, and other benchmarks such as environmental quality guidelines to determine the appropriate action level and management responses. Management responses may include additional monitoring or studies, adjustment of existing mitigation measures, or identification and implementation of new mitigation measures.

Additional information about the monitoring program design can be found in Section 4 of the CFMP and more details about the adaptive management framework can be found in Section 6 of the CFMP.

2.3 CFMP STUDY AREA

The CFMP study area is the same as the study area used in the updated HHRA (Entia 2022b). The CFMP study area is based on an overlay of the air quality modelling domain, the surface water quality local study area (LSA), and the terrestrial LSA used in the Application/EIS and in the Joint Application. The air quality, surface water quality and terrestrial study areas were used as the foundation for the CFMP study area because they represent key transport or exposure pathways between COPCs in environmental media and human receptors. The LSAs or modelling domains were used (rather than the larger, regional study areas) because any effects due to the Mine are likely to be highest in the areas closest to Mine sources of COPCs at the mine site. Since the air quality modelling domain is larger than the other two LSAs, the CFMP study area is effectively equivalent to the air quality modelling domain (Figure 2.3-1).

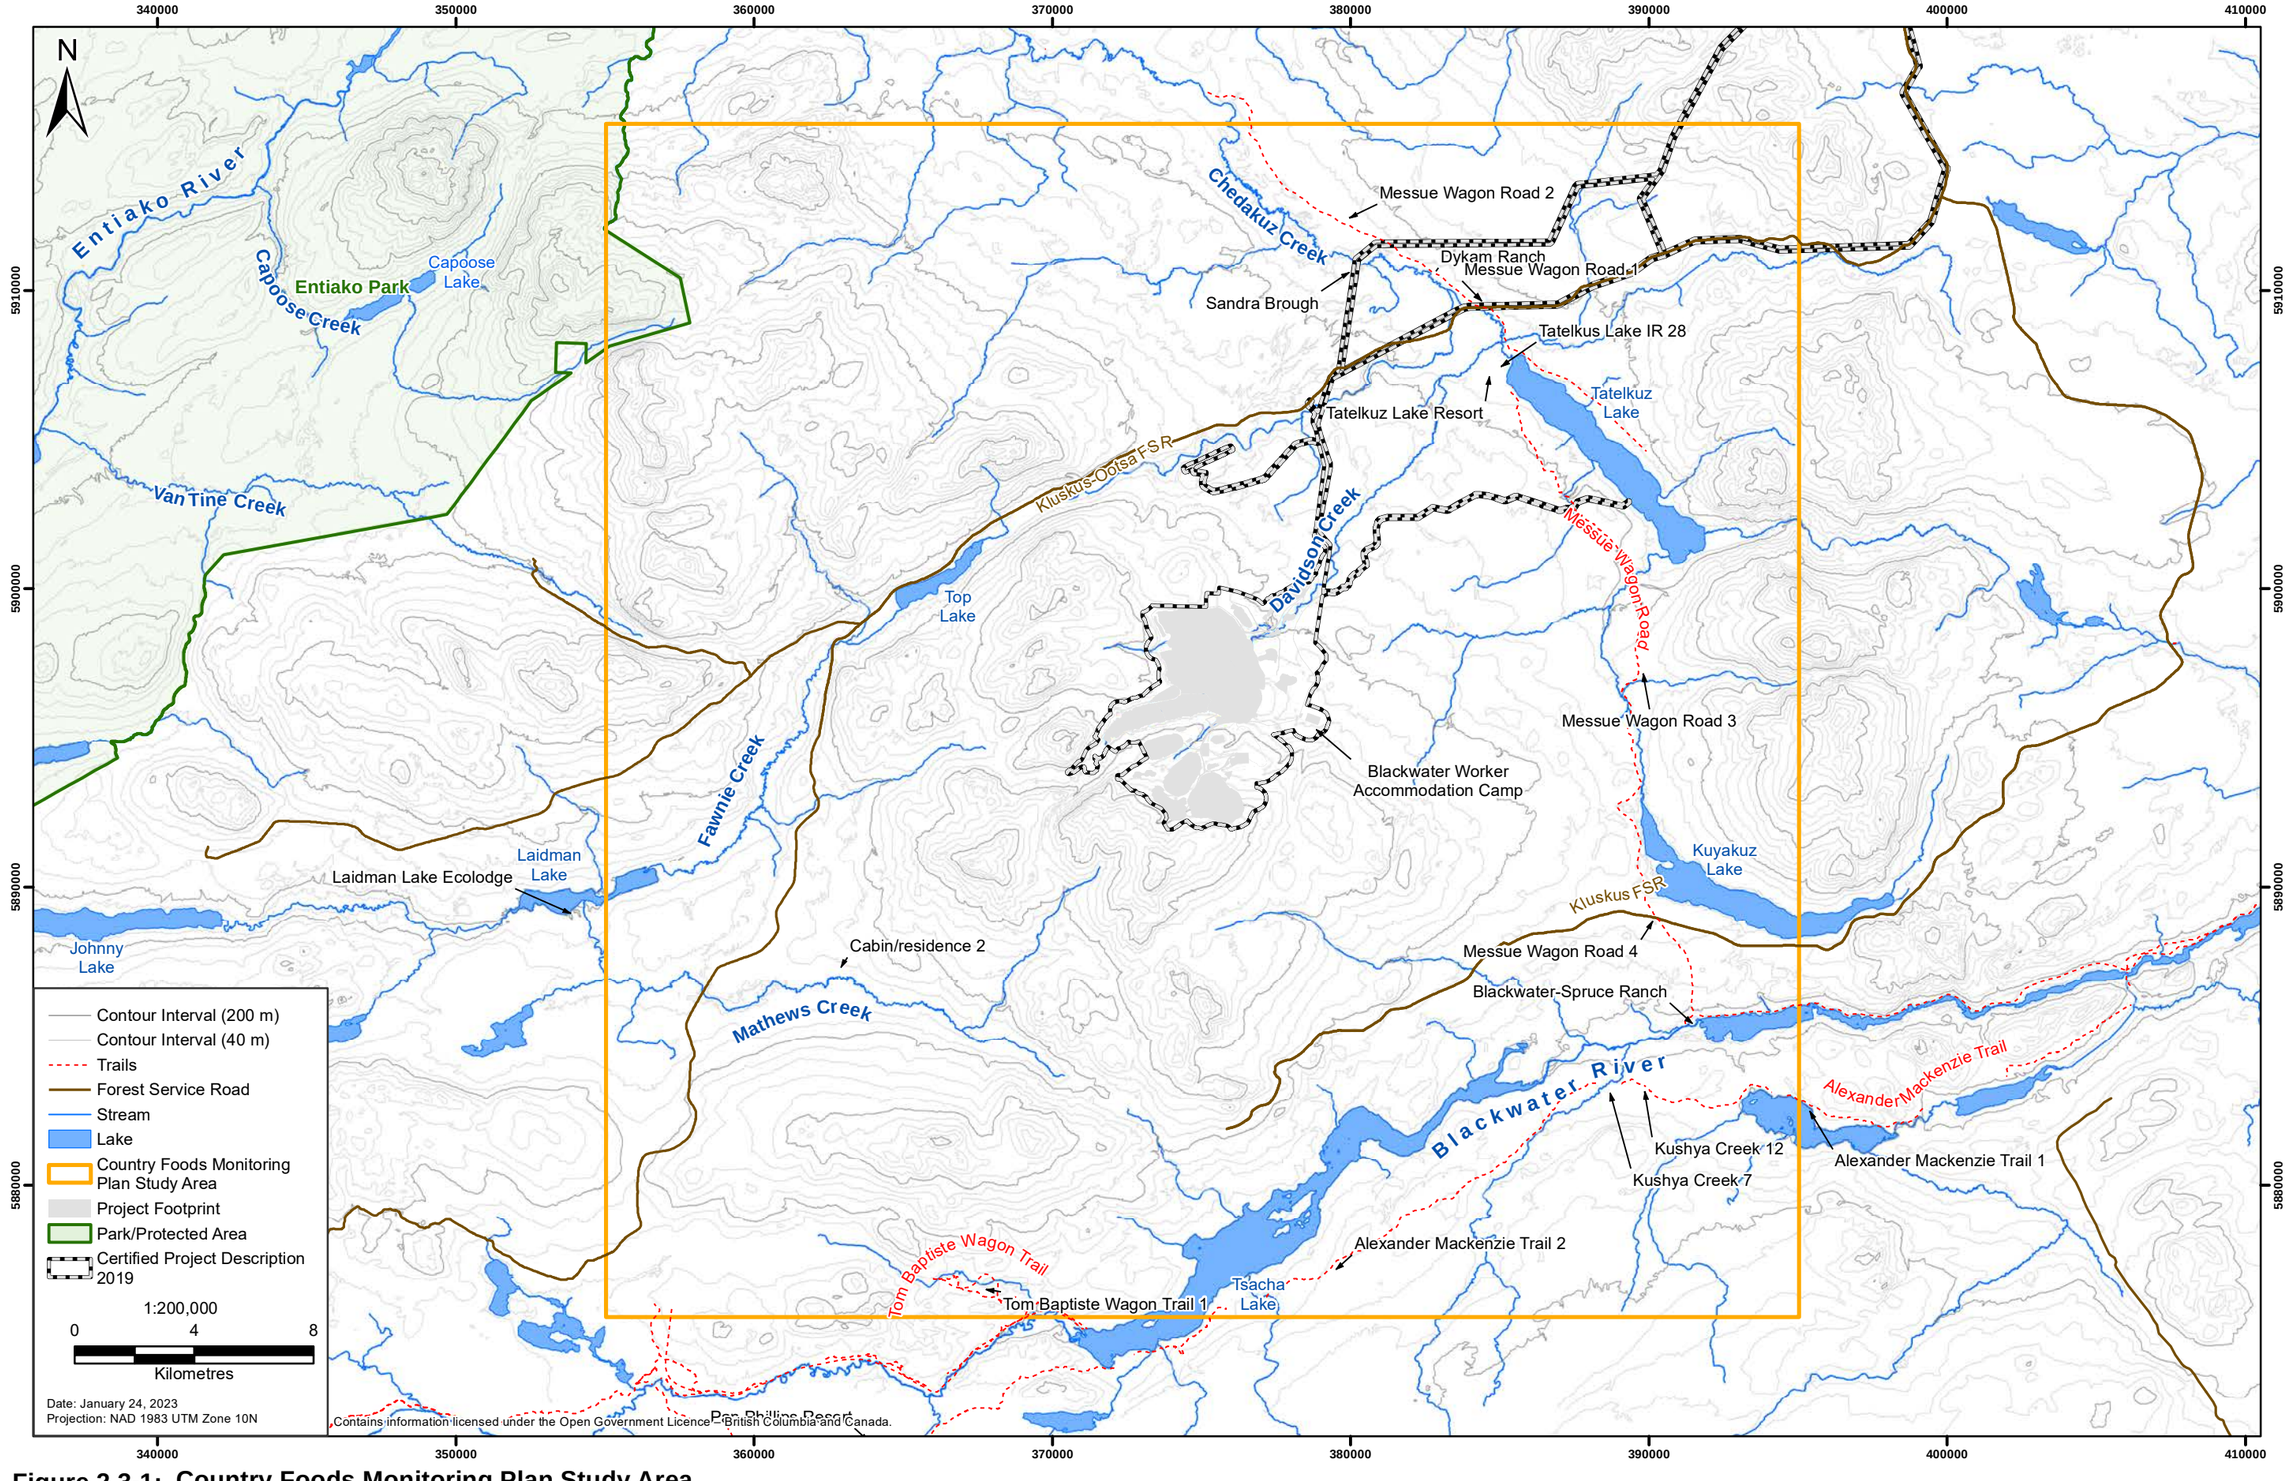

Figure 2.3-1: Country Foods Monitoring Plan Study Area

Some water quality baseline and monitoring sites (e.g., CC-30, CC-40) were located outside of the CFMP study area but were included in the CFMP reporting as they are of interest to the Carrier Sekani First Nation (CFSN) and are located downstream of the mine site (far-field impact sites in the Aquatic Effects Monitoring Plan [AEMP]).

2.4 LINKAGES TO OTHER MANAGEMENT AND MONITORING PLANS

A series of management and monitoring plans have been developed for the Mine. Many of these plans outline monitoring commitments relevant to the CFMP objectives and, where possible, the sampling requirements under other plans align with the sampling requirements for the CFMP. The CFMP relies on the monitoring and associated results from several of the plans, as follows:

- Aquatic Effects Monitoring Plan (AEMP; BW Gold 2022a):
  - Data collected under the AEMP will be used to fulfill requirements for CFMP sampling of water and fish tissue (EAC Condition 41(d)(vi) and 41(d)(vii), federal Decision Statement condition 6.11).
  - The AEMP outlines requirements for monitoring of water and fish tissue at various sites in the downstream aquatic receiving environment and at control sites.
  - Water and fish (juvenile Rainbow Trout) tissue samples will be co-collected at stream sites including near-field impact sites in Davidson Creek (DC-05 and DC-15) and Creek 661 (661-05 and 661-10), and reference sites in Creek 705 (705-05, 705-10) and a Fawnie Creek tributary (FC-01). Sampling will also be done in Turtle Creek (TC-01, TC-05, and TC-10) once the airstrip is constructed for the Mine.
  - Water and fish (adult Kokanee, Rainbow Trout, and Mountain Whitefish) tissue samples will be co-collected at lake sites including Tatelkuz Lake (potential impact site) and Kuyakuz Lake (control site).
- Air Quality and Fugitive Dust Management Plan (AQDMP; ERM 2023a):
  - Data collected under the AQDMP will be used to fulfill requirements for CFMP sampling of meteorological conditions and CACs (EAC Condition 41(d)(iii), federal Decision Statement condition 6.12).
  - The AQDMP outlines requirements for monitoring of meteorological conditions (e.g., air temperature, relative humidity, precipitation, wind speed and direction, barometric pressure, snow depth, net radiation, and solar radiation) in two locations.
  - The AQDMP also includes monitoring of CACs including particulate matter (PM) of less than 10 microns in diameter (PM_{10}) and less than 2.5 microns in diameter ($PM_{2.5}$), nitrogen dioxide (NO_2), and sulfur dioxide (SO_2).

3. SAMPLING AND DATA ANALYSIS METHODS UNDER THE CFMP IN 2023

Early Works construction activity began in October 2022. Construction activity continued from January to December 2023. Of the sampling described under the CFMP (see Section 4 of the CFMP), the following environmental media and country foods were sampled between January and December 2023: air (dustfall), soil, vegetation (plants and berries), surface water, fish tissues, and small mammal tissues. The Indigenous-led program for sampling and laboratory analysis of game animals that are hunted or trapped in the CFMP study area was initiated in 2023 in time for the fall hunting season.

3.1 AIR QUALITY (DUSTFALL)

Monitoring methodology for air quality is described in detail in Section 9.3 of the AQDMP (ERM 2023a) and in the AQDMP Annual Report (Artemis Gold 2024). As described in Section 2, CACs (including particulate matter PM_{10} and $PM_{2.5}$, SO_2, NO_2) are not COPCs based on the results of the CSM (Entia 2022a) and the HHRA (Entia 2022b), but are covered under the AQDMP (ERM 2023a). However, inhalable metals (i.e., metals attached to PM_{10}) were included as COPCs in the HHRA (Entia 2022b) and are covered under the CFMP (ERM 2022).

In September 2022, Stantec provided training to three BW Gold employees from the Environmental department on the operation of the Thermo Scientific Partisol-FRM Model 2025i-D PM sampler (Partisol) and particulate matter sampling. Details on the training are provided in the 2022 AQDMP Annual Report (BW Gold 2023). Additional training on this unit was provided by Stantec in September 2023 and again by CD Nova in November 2023.

The Partisol sampler was installed adjacent to the current exploration camp in Q1 of 2023. Fifty-four (54) coarse and fine particulate matter, PM_{10}, and $PM_{2.5}$, samples were obtained at approximately weekly intervals in March/April and November/December 2023, and every third day between May and October 2023 from the Partisol sampler. Particulate matter concentration data (PM_{10}, and $PM_{2.5}$) are presented in the AQDMP Annual Report (Artemis Gold 2024).

TABLE 3.1-1 2023 CFMP DUSTFALL SAMPLING SITES

Site ID	UTM Coordinates		Site Classification	
	Easting	Northing	Near- Field (Impact)	Control
CFMP-SV-004	371485	5896139	X	
CFMP-SV-006	374417	5891796	X	
CFMP-SV-014	379289	5898605	X	
CFMP-SV-019	377967	5900722	X	
CFMP-SV-024	375822	5907513		X
CFMP-SV-027	386022	5902891		X
CFMP-SV-032	368437	5880920		X
CFMP-SV-040	388451	5905960		X

A Passive Air Sampling System (PASS) for the collection of NO_2 and SO_2 concentrations was set up alongside the Partisol sampler. Data are reported in the annual report under the AQDMP.

Analysis results for dustfall metal samples collected from eight stations in September of 2023 are presented in this CFMP Annual Report. Dustfall collectors were deployed from September 3 to 8, 2023. ERM's sampling crew deployed five out of eight dustfall containers, while the remaining three dustfall containers were set up by the Blackwater environmental team. Four dustfall stations were located in the near-field area at sites CFMP-SV-004, -006, -014, and -019; and four sites were located in the control area at sites CFMP-SV-024, -027, -032, and -040. Site 004 had been affected by the July 2023 wildfire, but dust collectors were set up after fire activity had ceased and it was safe for crews to enter the area. Sites are shown on Figure 3.1-1 and listed in Table 3.1-1.

3.1.1 DEVIATIONS FROM CFMP SAMPLING METHODOLOGY FOR AIR QUALITY

Generally, sampling of air quality (dustfall) was completed as described in Section 4.3 of the CFMP. However, due to the Davidson Creek wildfire and the consequent evacuation of the mine site for much of July, the 2023 field season was compressed. As a result, the exposure of the dust cannisters was shortened from the minimum period of 30 days described in Section 4.2.2 of the CFMP to 12 to 24 days (depending on site) to ensure safety of field crews. This may have contributed to some dustfall metal and total dustfall amounts being non-detectable in some samples thereby increasing uncertainty, as described in Section 4.2.

3.2 SOIL QUALITY

Soil samples were co-collected with vegetation during two field trips in early and late September 2023. Thirty-nine sites in near-field, mid-field, and control areas, at the same locations as in 2021 and 2022 baseline studies, were planned to be sampled again in 2023.

In addition to the 39 original sites, six new sites (CFMP-SV-041 to -046) were added to the sampling program in 2023 to improve the power of the Before-after Control-impact (BACI) analysis for future effects assessment, as recommended in the 2022 CFMP Annual Report (ERM 2023d). These sites were intended to be located in the near-field subarea, with additional control area samples to be placed in subsequent years. However, the new sites were placed into the mid-field subarea by the field crew due to a navigational error. These new sites will provide additional baseline data for the mid-field should spatial analysis of effects be required in the future. However, it is not recommended to continue routine sampling at these sites unless control-impact analysis identifies Mine effects in the near-field subarea and spatial analysis becomes necessary (medium to high trigger levels for soil and vegetation). An update of the CFMP version 1.0 to version 2.0 anticipated for later in 2024 will consider the number and location of sampling sites in the subareas.

During the two field trips, a total of 42 soil samples were obtained from 42 sites, plus 4 duplicate samples for quality assurance and quality control (QA/QC). The 42 samples included five road transect samples. Sampling sites are shown on Figure 3.1-1 and sites and their locations are listed in Table 3.2-1.

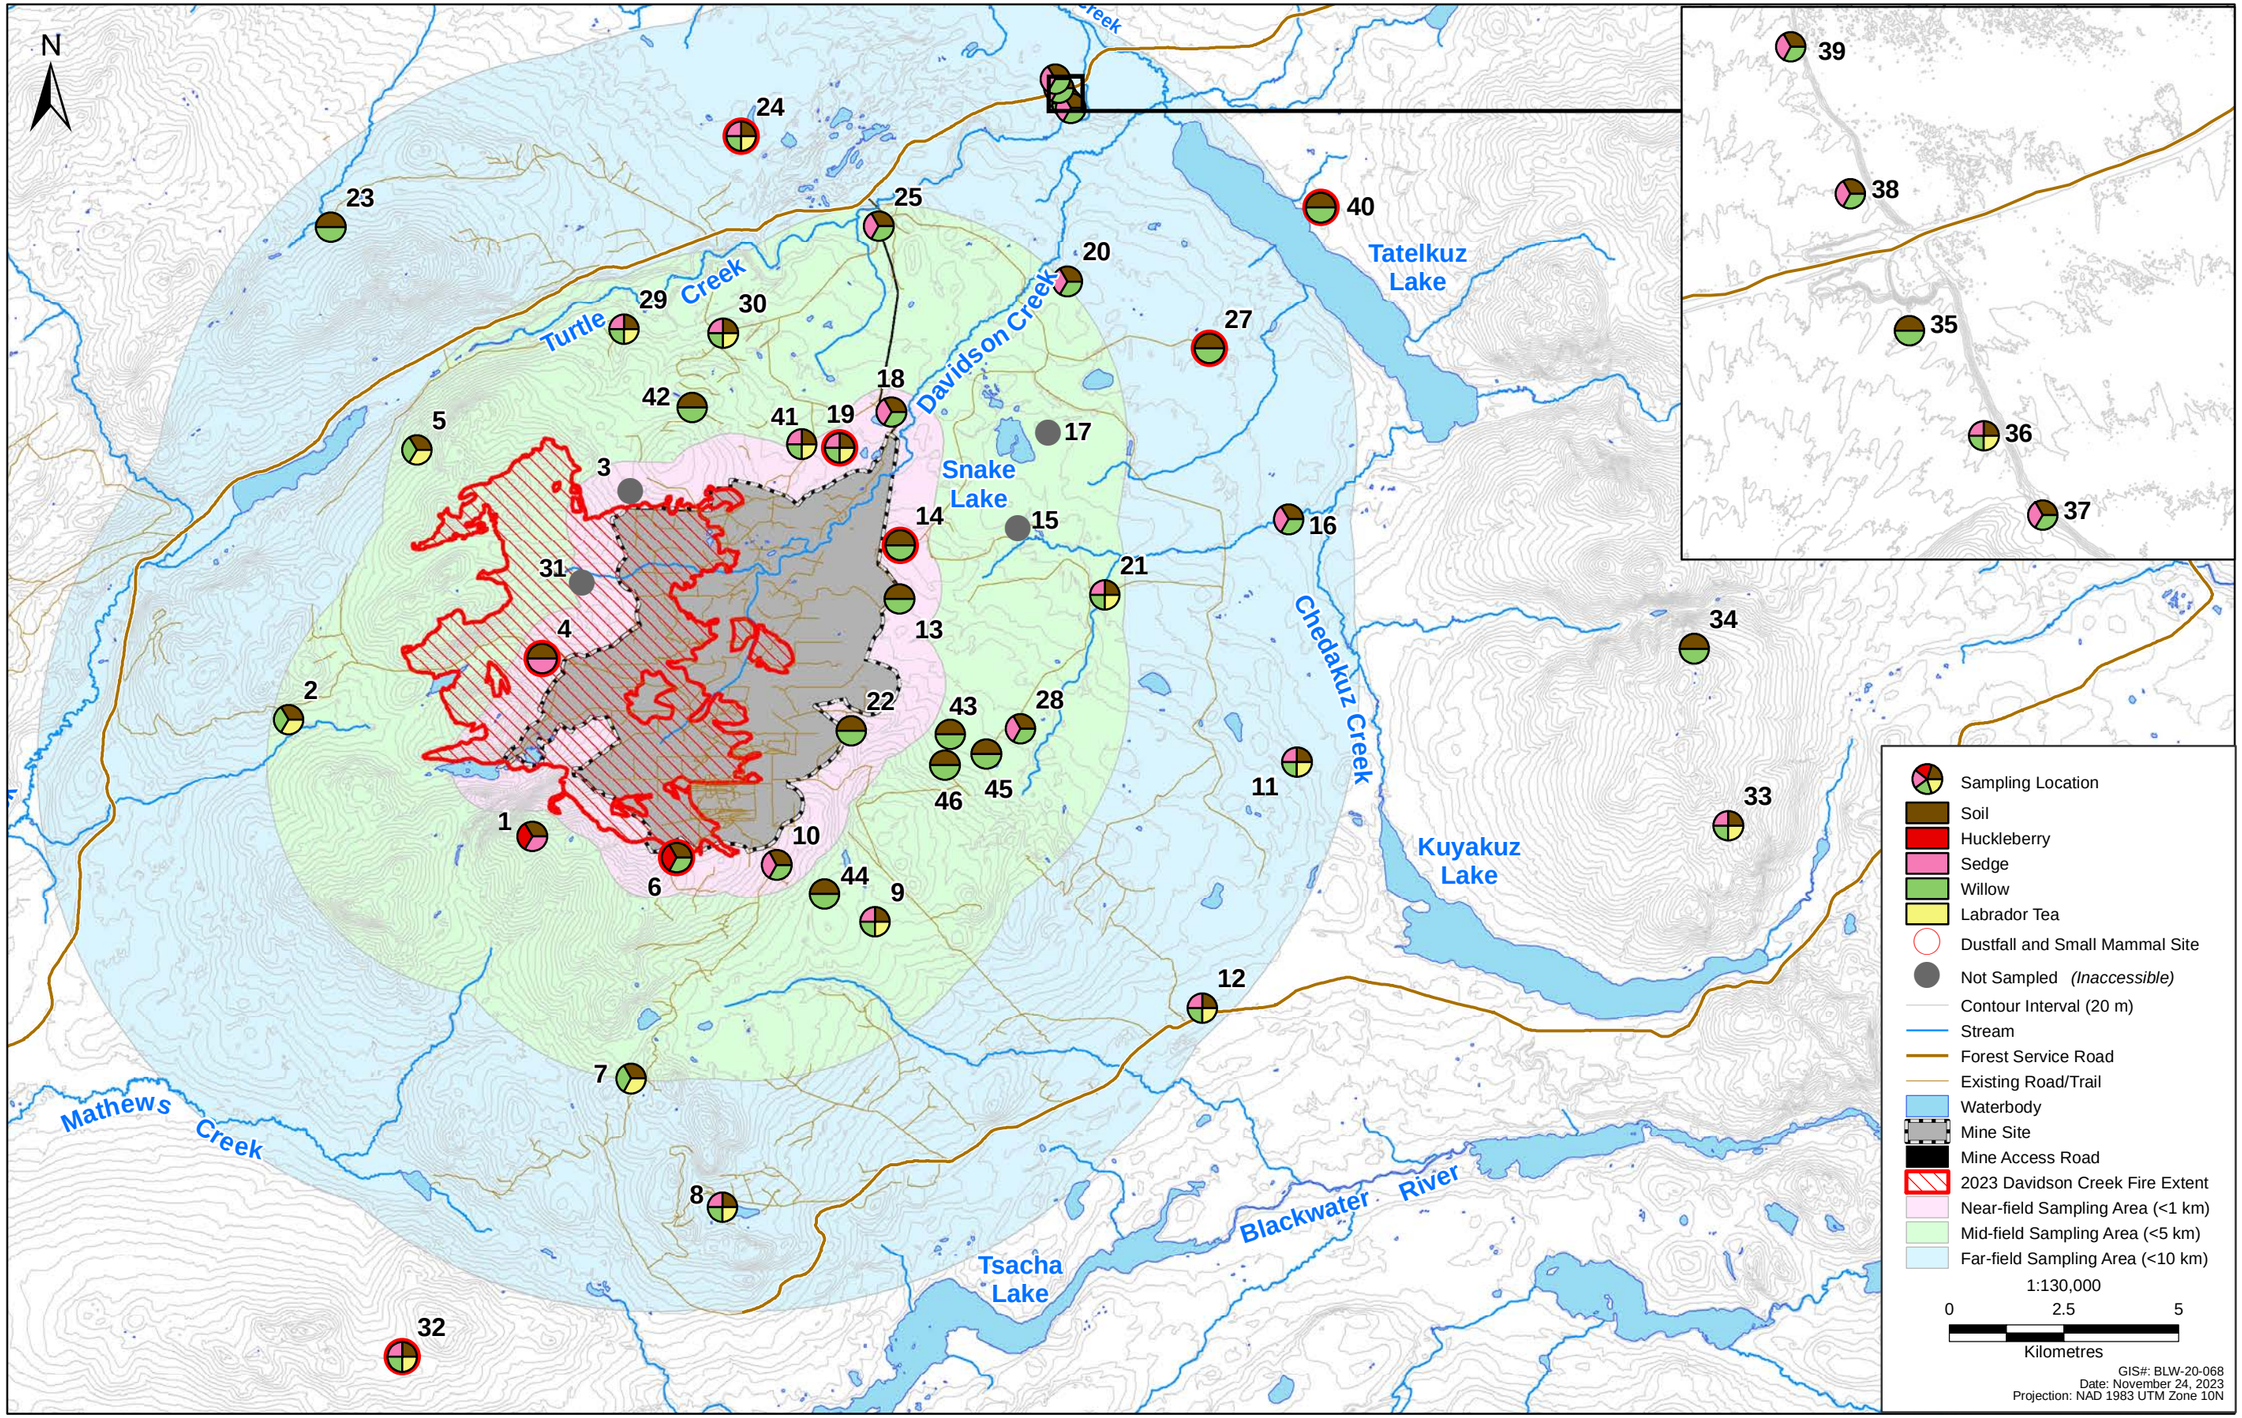

Figure 3.1-1: Dustfall, Soil, Plant, and Berry Sampling Sites, 2023, including the Extent of the 2023 Davidson Creek Fire

Notes:
Site CFMP-SV-040 was a new site added in 2022, as requested by Indigenous nation reviewers of the CFMP.
(a) Sites were inaccessible due to the 2023 Davidson Creek wildfire.
(b) Site was inaccessible due to overgrowth.

3.2.1 DEVIATIONS FROM CFMP SAMPLING METHODOLOGY FOR SOIL

Generally, sampling of soil was completed as per Section 4.3 of the CFMP. However, as noted previously in Section 1.3, soil was not sampled at three CFMP sites (CFMP-SV-031, -003, and -015) in 2023 due to wildfire impacts or safety issues in accessing the sites. As noted in Section 3.2, an additional six new sites in the mid-field area (CFMP-SV-041 to -046) were sampled instead of the recommended near field samples due to a navigational error.

3.3 PLANT AND BERRY QUALITY

During two field trips, a total of 79 vegetation samples consisting of 40 willow, 26 sedge, 14 Labrador tea, and 2 berry samples were obtained from 42 sites, plus 4 duplicate samples for QA/QC (willow leaves at sites CFMP-SV-007 and -013, sedge leaves at site CFMP-SV -007, and Labrador tea leaves at site CFMP-SV -019). Sampling sites are shown on Figure 3.1-1 and sites and their locations are listed in Table 3.2-1.

3.3.1 DEVIATIONS FROM CFMP SAMPLING METHODS FOR PLANTS AND BERRIES

Due to the 2023 Davidson Creek wildfire and the subsequent compression of the field season, there were a number of deviations from the sampling locations and methods described in Section 4.3 of the CFMP.

As described in Sections 1.3 and 3.2, due to the 2023 wildfire at the Mine site, 3 out of the original 39 soil and vegetation sampling sites could not be reached due to safety concerns and limited access. Sites CFMP-SV-003 and -031 were inaccessible due to the areas being too dangerous to access. Mid-field site CFMP-SV-015 had grown in and it was not accessible by helicopter (no safe landing site) or by road and was therefore not sampled. Site CFMP-SV-004 had been cleared previously by danger tree assessors and was accessible for sampling but had little vegetation (only sedges were sampled).

Due to a hot and dry summer the berry production throughout the CFMP study area was poor. Most sites that had berries collected in previous years had no berries in 2023. Only two huckleberry samples were collected in 2023, at sites CFMP-SV-001 (mid-field) and -006 (near-field).

Willow samples were obtained at all sites where soil was obtained, except at CFMP-SV-001, -004, and -017 as the delay in sampling due to the fire and the dryness had caused plants to drop their leaves. The change in sample number between years is unlikely to have large inter-annual effects as data are summarized for each sub-area (e.g., calculation of means and other summary statistics) prior to making comparisons as described in Section 4.4.

Sedge samples were obtained from 26 sites, and Labrador tea samples were obtained from 14 sites. Some samples that were collected in previous years at some sites could not be sampled in 2023 due to the delay of sampling after the wildfire (e.g., Labrador tea at CFMP-SV-004, -007, -010, and -021). Sedge and Labrador tea samples were collected at some sites where these species had not been sampled in the past (CFMP-SV-011, -012, and -025 [sedge only]) as the crew noted that the species were present at these sites and could be sampled.

A total of 79 vegetation samples were collected, including 4 duplicate samples (2 willow, 1 Labrador tea, and 1 sedge) were collected as part of the sampling program. Duplication was less than the 10% identified in the QA/QC program in Section 4.3.3 of the CFMP.

3.4 SURFACE WATER QUALITY

Surface water quality was monitored between January and December 2023 at the sites shown in Table 3.4-1. Sampling sites for surface water quality for the CFMP are shown on Figure 3.4-1 and are a subset of the sampling sites described in Section 4.2 of the AEMP.

TABLE 3.4-1 2023 CFMP SURFACE WATER SAMPLING SITES

Watershed or Lake	Site ID	Easting	Northing	Type of Site
Davidson Creek	DC-05	378205	5899299	near-field impact site

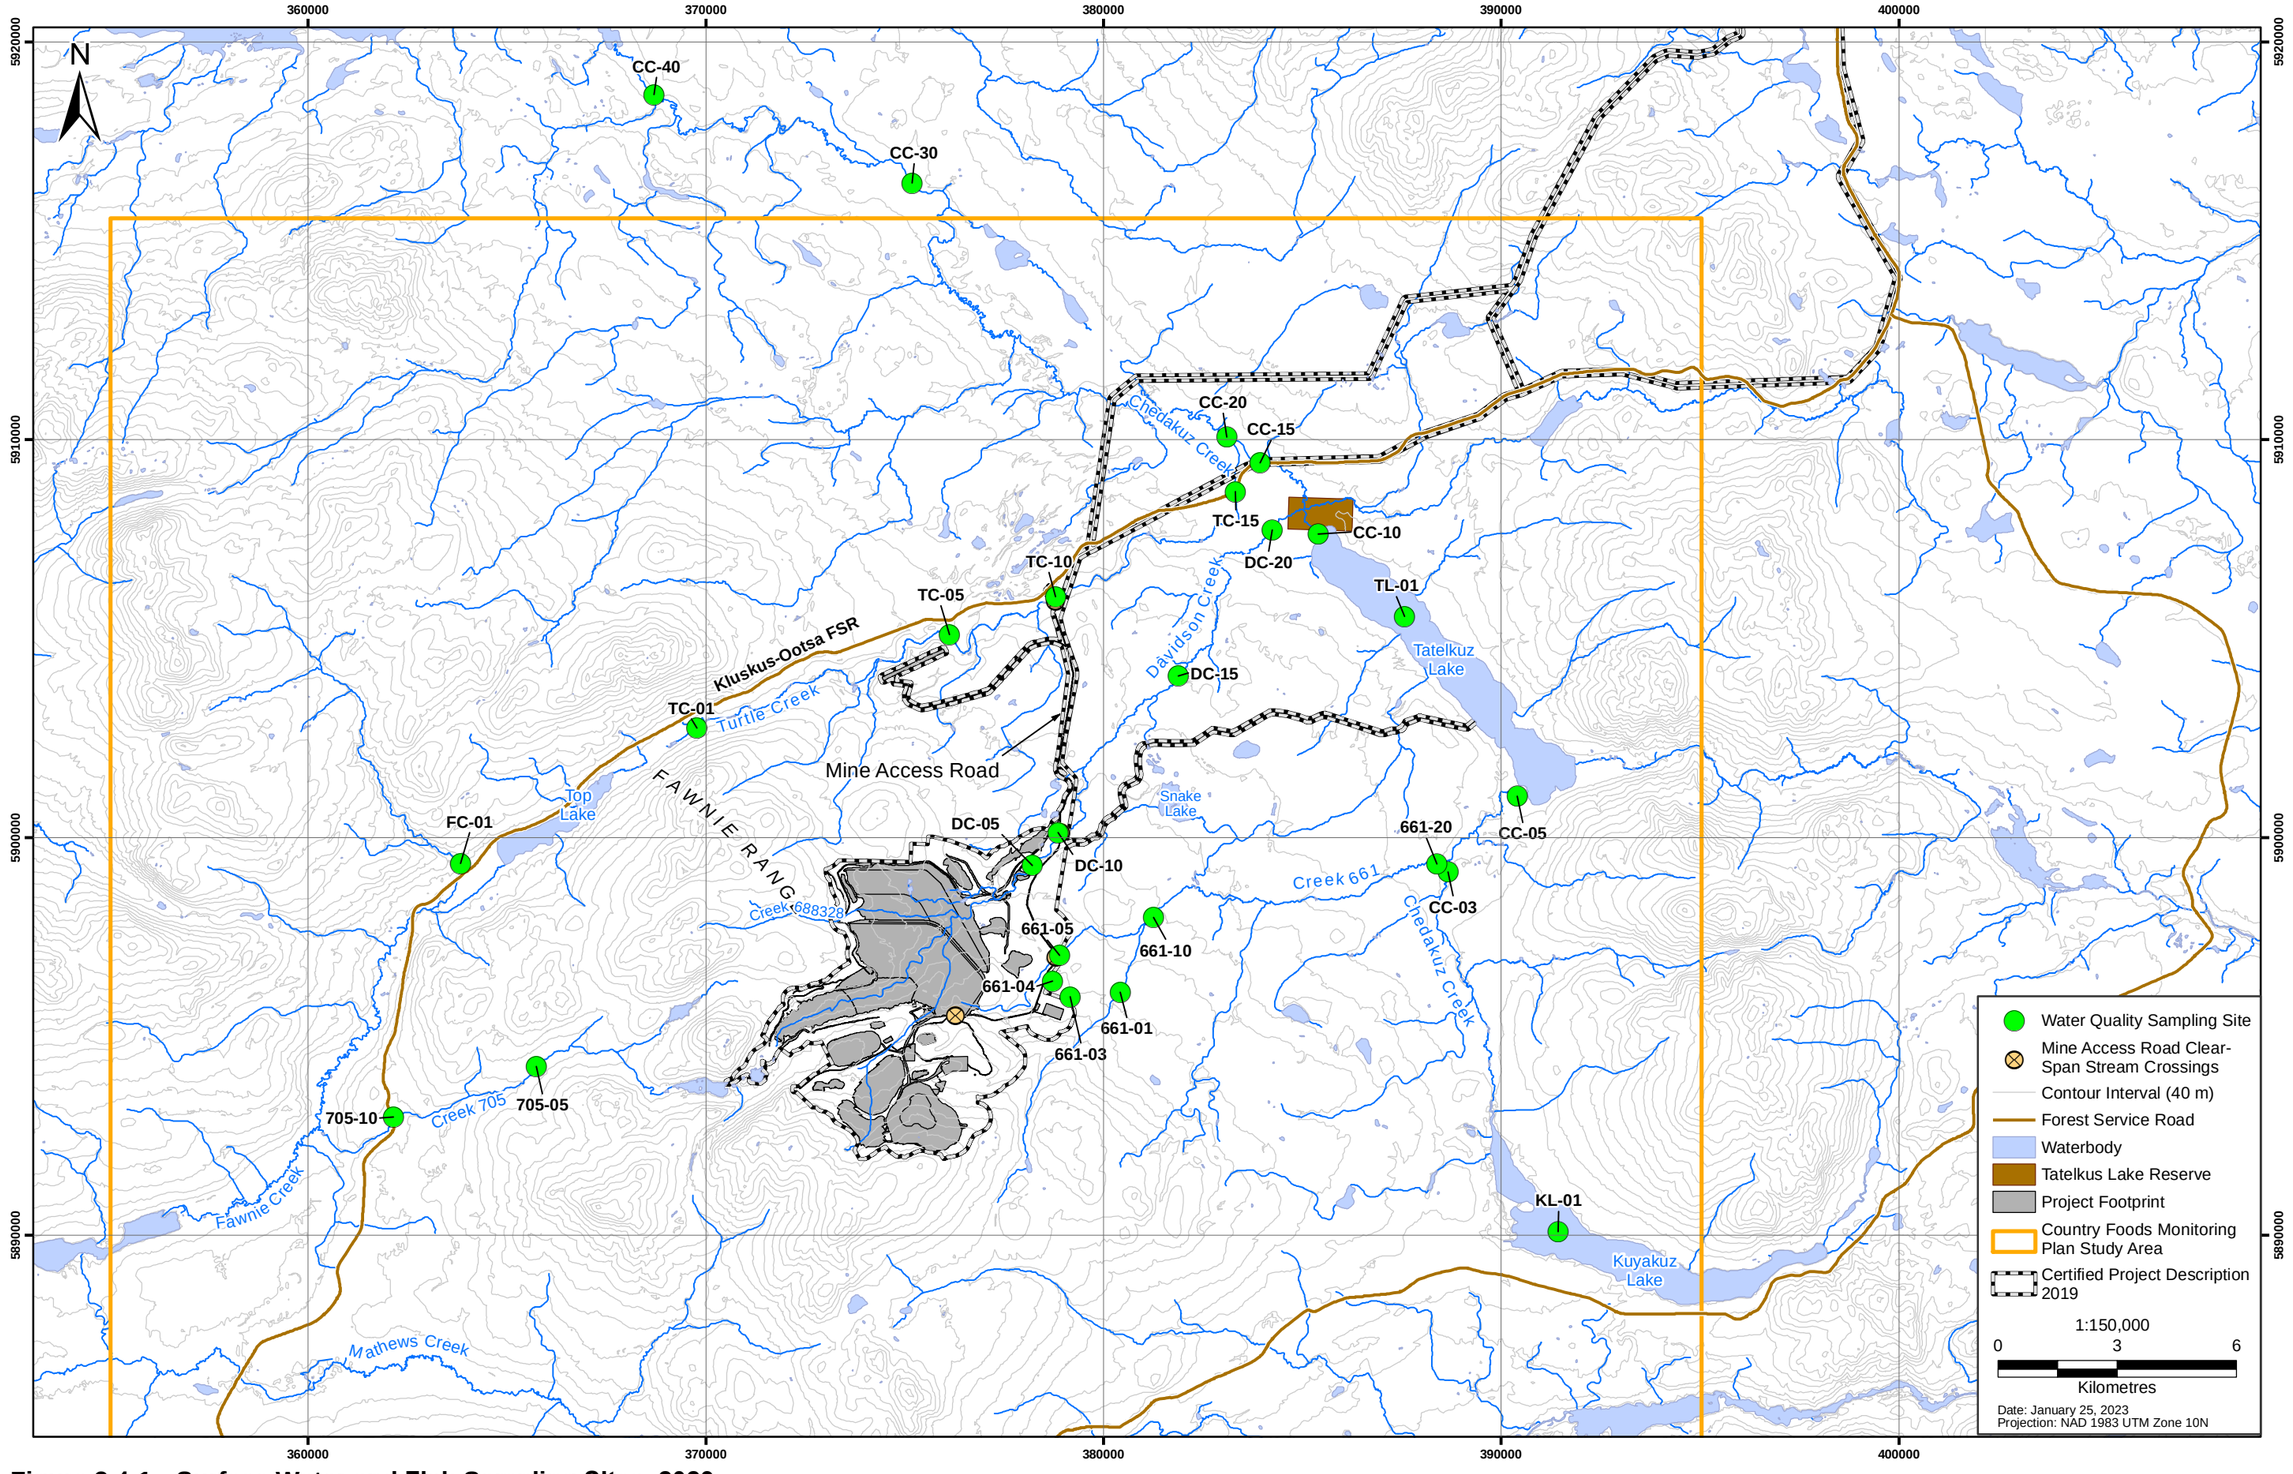

Figure 3.4-1: Surface Water and Fish Sampling Sites, 2023

Parameters analyzed in surface water quality samples included the 18 COPCs identified in Section 4.4.1 of the CFMP as well as additional physical parameters, general chemistry parameters (e.g., hardness), ions, and a full suite of total and dissolved metals that is required by Section 4.4.2.2 of the AEMP.

3.4.1 DEVIATIONS FROM CFMP SAMPLING METHODS

The sampling frequency and methods used in sampling surface water were as described in Section 4.4 of the CFMP, with minor exceptions. During the 2023 monitoring period, some water quality samples could not be collected due to conditions found in the field during sampling:

- Field measurements and water quality samples were not collected at 661-03 in January 2023 and at TC-15 in February 2023 because the stream was frozen to the bottom and there was no flow.
- The wildfire delayed field crews being able to access the surface water quality sites in July 2023 (and shortened the field season) therefore two of required surface water quality sites were not sampled (661-04 and TC-05).
- On occasion, field measurements were not collected (e.g., dissolved oxygen, field pH, conductivity, and turbidity) because of probe issues, lack of a turbidimeter, or operator error.

These minor exceptions are not expected to impact the data analysis under the CFMP. The QA/QC program for surface water quality sampling described in Section 4.4.3 of the CFMP was followed, including the collection of field duplicate samples and the use of trip and equipment blanks, as described in the AEMP. Laboratory-based QA/QC programs, consistent with the requirements of the British Columbia Environmental Laboratory Manual (BC ENV 2020a) were used. No exceptions in the QA/QC program were noted.

3.5 FISH TISSUE QUALITY

Fish tissue collection sites under the CFMP were control sites on Creek 705 (705-05 and 705-10), Turtle Creek (TC-01, TC-05, and TC-10; all sites in Turtle Creek are considered to be control sites until the air strip is constructed), Fawnie Creek (FC-01), and Kuyakuz Lake (KL-01), and impact sites on Creek 661 (661-01, 661-05, and 661-10), Davidson Creek (DC-05 and DC-15), and Tatelkuz Lake (TC-01).

Fish tissues were collected by Palmer Environmental following methods described in the AEMP Version 1.0 (July 2023) with some exceptions due to the Davidson Creek wildfire and a shortened field season (see Section 3.5.1). Due to wildfire-related delays, sampling commenced on August 25th and ended in late September (September 24th), which is slightly later than in previous years.

As per the AEMP, eight rainbow trout (RB) were targeted for tissue metals sampling per site (Figure 3.4-1). However, after completing three-pass electrofishing, no RB were captured at TC-01 (Turtle Creek; not sampled under the CFMP) and only 3 of 8 RB were captured at 661-05 (Creek 505659, a tributary to Creek 661). Additional fish sampling efforts were completed at 661-04 (near-field impact monitoring site at Creek 146920 downstream of Camp Site SCP Discharge location and a tributary to Creek 505659; not included in CFMP) where 8 RB were caught. Fish tissue analytical results from sites 661-05 were combined with those from 661-04 for

the purpose of statistical analysis and comparisons against numeric performance metrics (NPMs) to compensate for the low sample number at 661-05.

Sample designations in 2023 for Davidson Creek sites DC-05 and DC-15 were changed to DC-9/DC-05 and DC-5/DC-15, respectively, as those sites are both AEMP (and CFMP) and DS Condition 3.14 sites.

To decrease laboratory turnaround times and reduce sample handling, adult fish were dissected in the field prior to submitting tissue samples to ALS Laboratories for metals analysis. Tissue metal concentrations from whole-body juvenile RB and muscle tissue from adult RB, mountain whitefish (MW) and kokanee (KO) were combined in the statistical summaries.

3.5.1 DEVIATIONS FROM AEMP SAMPLING METHODS

Fish inventory sampling was completed at sites as indicated in Appendix C of PE-110652. Sampling methods were completed in accordance with the AEMP, Version 1.0, with some exceptions. Sites were sampled beginning on August 23, 2023 to September 22, 2023. Table 3.7-1 provides a summary of the exceptions from the sampling methods described in the AEMP Plan. The exceptions were either due of the wildfires in the Mine area in July 2023 or due to low fish abundance at targeted sites.

TABLE 3.7-1 SUMMARY OF EXCEPTIONS TO METHODS DUE TO WILDFIRES IN THE MINE AREA, 2023 FISH INVENTORY AND TISSUE METAL SAMPLING

Methods Indicated in AEMP Plan Version 1.0	Methods Completed in 2023
The fish community inventory survey will be completed in late July or early August.	Sampling commenced in mid-August and ended in late September.
The fish community inventory will be completed at eleven stream sites where surface water quality monitoring is completed to provide concurrent sampling at the same location.	Water quality sampling was not completed within 7 days of each fish community survey because of the associated logistical issues (shortened field season).
Tissue metals samples will be collected from eight euthanized Rainbow Trout per site.	After completing three-pass electrofishing, no Rainbow Trout were captured at TC-01 (Turtle Creek) and only 3 of 8 Rainbow Trout were captured at 661-05 (Creek 661). Additional fish sampling efforts were completed at 661-04 (near-field impact monitoring location not included in AEMP metals testing) where 8 Rainbow Trout were caught and submitted for metals analysis.

Notes:
AEMP = Aquatic Effects Monitoring Plan

3.6 MAMMAL TISSUE QUALITY

There are two components to the small mammal tissue sampling under the CFMP:

1. Collaboration with Indigenous groups, particularly with hunters and trappers, to develop an Indigenous-led program for sampling and laboratory analysis of game animals that are hunted or trapped within the CFMP study area (donated samples); and
2. A small mammal (rodent) sampling program. This program was initially designed to only be initiated and completed if triggered through the trigger response framework (see CFMP Version 1) but was updated to be conducted as a baseline program and a continued program irrespective of the proposed triggers (ERM 2023e).

Both components of the program were initiated in 2023 as baseline collection programs as no sampling had been conducted previously and effects from Early Works Construction on small mammal tissue quality were expected to be limited. Rationales and context for the components of this program were provided in January 2023 in the *Framework for the Collection Program for Rodents* (ERM 2023e) and will be included in the update to the CFMP anticipated for 2024.

3.6.1 HUNTED GAME ANIMAL PROGRAM

For the first component (donated game tissue), BW Gold initiated the program in 2023 by designing and placing posters inviting participants to donate samples of their hunted game for analysis. The posters with instructions on how to participate and where to obtain sampling equipment were posted at the mine site, in the Band Office and Lands and Resources Office of LDN/UFN, and online. Information pamphlets with instructions to hunters and a wildlife data collection form were also prepared and available to participants. No tissue samples were donated to the program in 2023.

3.6.2 SMALL MAMMAL (RODENT) SAMPLING PROGRAM

For the second component (small mammal sampling), the crew set up small mammal live traps in September of 2023 at or within 100m of the established near-field and control subarea dustfall sampling sites. Sampling proceeded as per the methodology described in the *BWG Framework for the Collection Program for Rodents* (ERM 2023e) and as permitted by the BC Animal Care permits SM22-781203 and PG23-781042 under the *Wildlife Act*.

Both Western deer mice (*Peromyscus maniculatus*; DM*)* and Southern red-backed voles (*Myodes gapperi*; RBV) were trapped as most sites hosted both species (Photo 3.6-1 and 3.6-2). Dissections of the animals were conducted off-site after conclusion of the field trip and livers were surgically removed. Livers and carcass (body excluding the liver) were subsequently re-frozen to be shipped to ALS Laboratories, Burnaby, BC for analysis of metal concentrations in tissues. A total of 32 DM and 25 RBVs were captured.

Bioaccumulation factors from soil or plant/berries to rodents can be calculated in future as the ratio of the measured metal concentration in the animal tissue over the measured metal concentration in soil, plants, and/or berries. The calculated bioaccumulation factors can be compared to those used in the food chain model in the *HHRA Update* report (Entia 2022b) for rodents (hare). This will provide an indication of the extent to which metals are taken up by rodents from exposure media (i.e., soil or food) into the tissues.

Photo 3.6-1 Red-backed vole (*Myodes gapperi*) trapped during the small mammal sampling program.

Photo 3.6-2 Western deer mouse (*Peromyscus maniculatus*) trapped during the small mammal sampling program.

3.6.2.1 DEVIATIONS FROM THE CFMP SAMPLING METHODOLOGY FOR SMALL MAMMALS (RODENTS)

The intention of the *BWG Framework for the Collection Program for Rodents* (ERM 2023e) was to collect either Southern red-backed voles or Western deer mice to limit potential variation in tissue quality results due to anticipated inherent species-specific variability resulting from different life histories and physiologies of the two species. However, live traps caught insufficient ($n < 8$) animals of either species at most sites after several days of sampling that would allow targeting of just a single species. The decision was made in the field to broaden the collection to both species.

Initially, Sherman live traps were set up and checked daily with the objective to capture live rodents for subsequent humane euthanasia using acceptable measures (cervical dislocation) outlined in *The Guidelines On: The Care and Use of Wildlife* (CCAC 2003) and *AVMA Guidelines on Euthanasia* (AVMA 2020) and in accordance with *Wildlife Act* permits SM22-781203 and PG23-781042. However, small mammals were often found to be dead or in torpor in the traps and the number of trapped animals was generally low. To meet sample size objectives and to adopt a more humane sampling approach, Sherman live traps were augmented with snap (kill) traps.

As there was no space for dissection of mammals on site and due to time limitations, whole mammals were frozen and subsequently dissected off-site prior to shipping to the laboratory.

3.7 DATA ANALYSIS

3.7.1 SUMMARY STATISTICS

Raw data were compiled in Excel, sourced from Certificates of Analysis (COA) provided by the laboratory for 2023 data. Summary statistics were calculated in Excel for dust, soil, vegetation, fish, and small mammal tissues, including calculation of the minimum, mean, standard deviation, standard error, 95% upper confidence limit of the mean (UCLM), median, 95th percentile, and maximum, and a count of samples with concentrations greater than the detection limit (DL). For surface water quality data, summary statistics were compiled in R (a programming language and software environment for statistical computing; R Development Core Team 2022).

The DL is the lowest detectable concentration, as reported by the laboratory. For the purpose of calculating summary statistics, when metal concentrations in water, dust, soil, plant, fish, and small mammal tissues were below the DL, a value of half the DL was substituted. Although this methodology for addressing what are essentially missing values does not capture the true frequency distribution of the concentrations (Nosal, Legge, and Krupa 2000), assigning values to undetected concentrations in this manner is common practice where it can be assumed the values are not zero but where the level of risk is low enough not to warrant additional statistical analyses (i.e., with regards to human health; US EPA 2000). Substituting concentrations below the DL with concentrations of half the DL is also recommended by BC ENV (2016) and was also used in the *Blackwater Gold Project: Human Health Risk Assessment Update* (HHRA Update) report (Entia 2021, 2022a,b).

For the purposes of calculating summary statistics, duplicate sample concentrations were averaged and evaluated as one sample, represented by the average concentration of the analytical results for the duplicate and parent sample. Where the halved laboratory DL exceeded applicable standards or guideline limits, these parameters were not considered to have exceeded standards. For parameters where the concentrations were highly censored (i.e., more than 70% of samples were below DL), only the minimum and maximum concentrations are shown, as other summary statistics (particularly parametric summary statistics such as mean or 95% UCLM) are considered to be too unreliable.

3.7.2 OVERVIEW OF STATISTICAL COMPARISONS AND BACI

This section provides an overview of statistical analysis and comparisons used for this report. Further details are provided in the "*Statistical Analysis*" subsections for each environmental medium or tissue (Section 4) of this report.

Prior to completing statistical comparisons between years (baseline prior to October 2022 and 2023) or between subareas (near-field [impact] *vs*. control), the data were screened and evaluated for inclusion or exclusion from the analysis. Data or statistical comparisons were excluded based on the following criteria:

- Metal parameters that were not identified as COPCs in the CFMP (ERM 2022) were excluded from the analysis.
- In each analysis, highly censored COPCs (i.e., where more than 70% of data had concentrations below the DL) were considered unreliable and were not used in the statistical analysis (as per Section 5 of the CFMP, ERM 2022).

- The analysis was performed on COPCs with at least five samples in each group or subarea (e.g., near, mid, control). For smaller number of samples (n < 5), the power of the statistical tests was considered to be too low to reliably detect significant differences between or among groups.

Data were log transformed to reduce the skewness of the original concentration data.

The statistical comparisons were carried out in R using a linear mixed-effects model to compare between years (or between subareas) while controlling for repeated measurements across sites. To reduce the number of false positives (Type I error) due to the large number of statistical tests conducted (i.e., to control for multiple testing), a false-discovery rate correction (Benjamini and Hochberg 1995) was applied and each test was assessed relative to an alpha of 0.05 using adjusted p-values. This p-value correction was applied across all tests in soil, vegetation, and fish tissues separately.

4. DATA ANALYSIS RESULTS AND INTERPRETATION

4.1 MEASUREMENT ENDPOINTS, ASSESSMENT ENDPOINTS, AND QUESTIONS FOR DATA ANALYSIS

As described in the CFMP, the assessment endpoints are based on comparisons of COPC concentrations measured during the monitoring period to predicted COPC concentrations (Predicted NPMs), baseline COPC concentrations (Baseline NPMs), and to guidelines or standards (Guideline NPMs; Table 4.1-1) within a trigger response framework under the CFMP (Table 6.3-4 of the CFMP).

TABLE 4.1-1 MEASUREMENT AND ASSESSMENT ENDPOINTS

Measurement Endpoint	Assessment Endpoint
COPC concentrations in air, water, soil, and country foods (plants, berries, and fish tissue)	• Comparison of measured concentrations to predicted concentrations (Predicted NPMs) • Comparison of measured concentrations to baseline concentrations (Baseline NPMs) • Comparison of measured concentrations to applicable environmental media or tissue guidelines or country foods trigger benchmarks (Guideline NPMs) • Before-after-control-impact (BACI) analysis if a NPM is exceeded

Evaluation of results for the 2023 Construction period was performed as described in Section 5 of the CFMP. The evaluation intends to answer the following questions (see Section 5.1 of the CFMP for additional details):

- **Question 1:** Are COPC concentrations in environmental media and tissues different than were predicted in the predictive model and used in the HHRA?
- **Question 2**: Are COPC concentrations in environmental media and tissues changing relative to baseline conditions due to Mine-related discharges or emissions?
- **Question 3**: If concentrations are different than baseline and different than predicted, are the changes statistically significant or exceeding levels of concern (i.e., guidelines or human health-specific benchmarks)? What is the extent of Mine-related influence on COPC concentrations in environmental media and tissues?

The derivation of NPMs for answering Questions 1 to 3 and for defining action levels in the adaptive management framework was presented in the *Blackwater Gold Project: Human Health Triggers for Adaptive Management* (HHTAM) report (ERM 2023f), which was completed in May 2023. Reviewer comments for the HHTAM report were received from Northern Health on January 9, 2024 and from Shared Value Solutions on behalf of UFN/LDN and Health Canada at the end of January 2024. During review and responses to the comments received in January 2024, NPMs and their derivation will be checked and revised, as necessary; however, timelines for CFMP annual report preparation (December 2023 to February 2024) and submission (March 31, 2024) did not allow incorporation of any changes to the HHTAM report into this annual report. Future annual reports will consider any changes that were made to triggers in the HHTAM report or the CFMP during the review process.

The general methodology to answer these three questions is described in Section 5.2 of the CFMP. Briefly, to answer:

- **Question 1**, mean concentrations measured at impact sites for air, water, soil, and country foods will be compared to the Predicted NPM concentrations for Construction derived using predictions in the *Blackwater Gold Project: Updated HHRA* report (Entia 2022a).
- To answer **Question 2**, mean of measured concentrations will be compared to Baseline NPMs for air, water, soil, and country foods to identify if there have been changes relative to baseline conditions.
- To help answer **Question 3** (exceedance of levels of concern), mean measured concentrations will be compared to Guideline NPMs, which were derived based on human health-based guidelines, standards, or benchmarks, as available in the *Human Health Triggers for Adaptive Management* report (ERM 2023f). To fully answer Question 3 in the case that NPMs are exceeded, BACI analysis is used to identify if there are statistically significant Mine-related impacts to COPC concentrations in air, water, soil, and country foods between baseline (up until September 2022) and the Construction period (October 2022 to December 2023).

4.2 AIR QUALITY MONITORING RESULTS

4.2.1 COARSE PARTICULATE MATTER AND DUSTFALL RESULTS

Particulate matter concentration data (24-hour PM_{10} and $PM_{2.5}$) measured at the exploration camp during construction are presented in the *AQDMP Annual Report* (Artemis Gold 2024). Statistical summaries for coarse particulate matter (particularly matter less than 10 microns in diameter, PM_{10}) obtained in 2023 are presented in Table 4.2-1 and were used to derive estimates for inhalable PM_{10}-associated metals from dustfall during Construction.

The BC Ambient Air Quality Objective (AAQO) for PM_{10} of 50 µg/m^3 was exceeded in 17% of the 54 samples, with a maximum concentration of 171 µg/m^3. Exceedances were reported to BC ENV by BW Gold on August 14, September 13, October 5 and 18, and December 5, 2023, and are discussed in the AQDMP Annual Report (Artemis Gold 2024). Depending on time of year and meteorological conditions, exceedances were likely due to construction activities next to the Partisol unit (additional exploration camp new housing buildings), the wood burning furnace approximately 25 m northeast of the Partisol (used periodically until the end of May 2023), smoke from nearby and regional wildfires, dust entrainment by strong winds, and vehicle movement on unpaved ground. During dry and dusty days with temperatures above freezing, water trucks run daily to minimize fugitive dust that may occur on roadways or due to construction activities. A QP has recommended to move the Partisol to a new location because the wood burning furnace and the increase in infrastructure has impacted the monitoring results (Artemis Gold 2024). To support this recommendation, BWG is pursuing an amendment to PE-110650 to relocate the unit. The revised location is still situated near the Construction Camp, however it is further away from busy unpaved roads and building structures. The Partisol will stay at the new location until the Operations camp is complete.

Raw data for amounts of total dustfall and dustfall metals (in mg and in mg/dm^2-day) as well as the period of sampling (in days) are presented in the laboratory Certificate of Analysis (COA) provided in Appendix A.1. Impact sites (CFMP-004, -006, -014, and 019) were sampled for dustfall for 23 to 24 days, and control sites (CFMP-024, -027, -032, and -040) were sampled for 12 to 21 days. Summary statistics for total dustfall and dustfall metal amounts for COPCs at impact and control sites and in the CFMP study area overall are shown in Table 4.2-2.

TABLE 4.2-1 SUMMARY STATISTICS FOR MEASUREMENTS OF COARSE PARTICULATE MATTER (24-HOUR PM_{10}), 2023

Parameter	n	Concentrations of PM_{10} at Exploration Camp Partisol Station (µg/m³)									Percent of n Exceeding AAQO
		Minimum	Mean	Standard Deviation	Standard Error	95%UCLM	Median	95th Percentile	Maximum	AAQO (24-hour)	
Particulate, $PM_{2.5}$	54	1.00	8.62	13.0	1.77	12.1	4.95	30.2	82.2	25	9

Notes:
n = total number of samples; PM = particulate matter; UCLM =upper confidence limit of the mean; AAQO = Ambient Air Quality Objective
Statistics exceeding the AAQO for 24-hour PM_{10} are shaded gray and bolded.

TABLE 4.2-2 SUMMARY STATISTICS FOR TOTAL DUSTFALL AND DUSTFALL METAL COPCS, 2023

Notes:
COPC = contaminant of potential concern; n = number of samples; DL = detection limit; UCLM = upper confidence limit of the mean
"<" = concentration is less than the detection limit.
"-" means that summary statistics, other than minimum and maximum, have not been calculated as more than 70% of samples were below DL.
For the purpose of calculating summary statistics, non-detectable concentrations were assumed to be 0.5 x DL.
Impact (near-field) sites are CFMP-SV-004, -006, -014, and -019, and control sites are CFMP-SV-024, -027, -032, and -040,

Mean total dustfall amount at impact sites was 4.34 mg, whereas total dustfall was not detectable at any of the control sites. Only aluminum, iron, lead, and manganese were sufficiently (>30% of samples) detectable in dustfall to calculate summary statistics. Three out of four impact sites had detectable levels of iron and lead, whereas lead was not detectable at control sites and iron was only detectable in one of the four control sites. Zinc was detectable at one impact site. Concentrations of COPCs overall were low.

The fraction of each detectable COPC in the amount of total dustfall was multiplied by the PM_{10} concentration estimate at offsite receptor locations. The PM_{10} estimate at offsite receptor locations, rather than the measured PM_{10} concentration, was used because PM_{10} was measured at the onsite workers camp and not at offsite receptor locations and would therefore over-estimate PM_{10}-associated metals in air for offsite receptors.

The offsite PM_{10} concentration estimate was derived as follows: modelled (predicted) Project PM_{10} concentrations were derived for the *Human Health Risk Assessment Update Report* (Entia 2021, 2022a) for offsite human receptor locations (Table 2.4-1 of the *HHRA Update* report) and for the future off-duty worker camp location. A maximum concentration of 11 µg/m^3 of PM_{10} at offsite receptor locations was modelled for the Messue Wagon Road 4 location, whereas the maximum at the off-duty worker camp location was modelled as 27 µg/m^3, resulting in a ratio of 2.45 between off-site and worker camp location concentrations. This ratio was applied to the mean annual concentration of 24-hour PM_{10} at the construction worker camp throughout 2023, which was 27.6 µg/m^3 (Table 4.2-1). Therefore, the estimated Construction phase off-site PM_{10} concentration is 11 µg/m^3, which is similar to the modelled off-site receptor PM_{10} concentration of 11 µg/m^3 from the *HHRA Update* report (Entia 2021, 2022a). This concentration was multiplied with the fraction of detectable 2023 metal COPC concentrations in each dustfall sample to derive the 2023 PM_{10}-associated COPC concentrations for off-site receptors. The conversions of dustfall data to PM_{10}-associated COPC concentrations are presented in tables in Appendix B.

The estimated PM_{10}-associated COPC concentrations for detectable COPCs (shown in Table 4.2-3) were then compared to the air quality (AQ) NPMs derived in the HHTAM report (ERM 2023f). Except for the AQ Guideline NPMs, which were based on Ontario Ambient Air Quality Criteria (OMECP AAQCs) and on the Texas Commission on Environmental Quality Effects Screening Levels (Texas CEQ ESL), the Baseline and the Predicted AQ NPM were based on Baseline and Predicted COPC concentrations in soil as per guidance from Health Canada (2019; updated in 2023) as concentrations of COPCs in air were not measured in baseline studies. Results of the comparisons are presented in the following Sections 4.2.2 to 4.2.4.

Figure 4.2.1 illustrate the estimated PM_{10}-associated COPC concentrations for detectable COPCs (i.e., aluminum, iron, lead, and manganese) at control and impact sites for the 2023 Construction period and Figure 4.2.2 includes data for the 2022 Baseline period.

TABLE 4.2-3 STUDY AREA-WIDE COMPARISON OF MEAN PM_{10}-ASSOCIATED COPC CONCENTRATIONS TO AQ GUIDELINE, BASELINE, AND PREDICTED NPMS, 2023

COPC	Estimated PM_{10} - associated COPC Concentration at Offsite Receptor Locations (mg/m^3)	AQ Guideline NPM (mg/m^3)	Baseline AQ NPM (mg/m^3)	Predicted AQ NPM (mg/m^3)
Aluminum	0.00014	0.0015	0.00014	0.00017
Antimony	NC	0.0005	0.0000000034	0.0000000045
Arsenic	NC	0.000067	0.000000052	0.000000066
Beryllium	NC	0.000002	0.0000000037	0.0000000047
Cadmium	NC	0.0000033	0.0000000026	0.0000000033
Chromium	NC	0.000041	0.00000015	0.00000019
Cobalt	NC	0.0000017	0.000000053	0.000000067
Copper	NC	0.001	0.000000109	0.00000016
Iron	0.00013	0.012	0.00020	0.00025
Lead	**0.00000020**	0.00015	0.000000067	0.000000086
Lithium	NC	0.0002	0.000000060	0.000000074
Manganese	**0.000073**	0.00025	0.0000095	0.000012
Mercury	NC	0.000025	0.00000000072	0.00000000091
Molybdenum	NC	0.0045	0.000000017	0.000000021
Nickel	NC	0.00002	0.000000098	0.00000012
Selenium	NC	0.0002	0.0000000018	0.0000000029
Thallium	NC	0.0001	0.00000000088	0.00000000111
Zinc	NC	0.002	0.00000060	0.00000078

Notes:
COPC = contaminant of potential concern; PM = particulate matter; AQ = air quality; NPM = Numerical Performance Metric.
NC = not calculated; PM_{10}-associated COPC concentrations were not calculated for parameters with more than 70% non-detects.
[a] The estimated PM_{10}-associated COPC concentrations in 2023 was based on the average proportion of COPC in total dustfall and the average estimated offsite 24-hour PM_{10} concentration of 11.2 mg/m^3.
See Appendix B for details.
Bold font means the PM_{10}-associated metal concentration was higher than both the Baseline and Predicted AQ NPM.

ERM

CLIENT: BW Gold LTD.

GRAPHICS NUMBER: BWG-24ERM-010:2

4.2.2 COMPARISON TO AQ GUIDELINE NPMS

As shown in Table 4.2-3, mean PM_{10}-associated concentrations of the four detectable COPCs (aluminum, iron, lead, manganese) were below the AQ Guideline NPM. The concentrations of all other COPCs were not calculated as they were not consistently detectable (i.e., detected in fewer than 30% of samples) in dustfall.

4.2.3 COMPARISON TO BASELINE AQ NPMS

Table 4.2-3 shows the calculated PM_{10}-associated metal concentrations and the Baseline AQ NPM. When amounts of COPCs were not detectable in more than 70% of samples (i.e., 30% non-detects), summary statistics were not calculated and concentrations are assumed to not exceed the Baseline AQ NPM.

The mean PM_{10}-associated concentrations of COPCs detectable in dust in 2023 were lower than the Baseline AQ NPMs for aluminum and iron, but higher than the Baseline AQ NPMs for lead and manganese by up to eight times. A number of reasons likely account for this:

- The baseline PM_{10} concentration of 9 $\mu g/m^3$ that was used to calculate the Baseline AQ NPM is less than the measured mean PM_{10} concentration of 11.2 $\mu g/m^3$ used to derive PM_{10}-associated metal COPC concentrations for the 2023 monitoring period. This result is not unexpected, as PM_{10} concentrations were predicted to increase relative to baseline conditions during Mine Construction and Operations phases.
- Baseline AQ NPMs were derived using metal concentrations in soil because baseline dustfall measurements were not available, as recommended in Health Canada (2019). Metal concentrations in soil can differ from metal concentrations in dustfall. For instance, the 95% UCLM concentrations of aluminum, iron, lead, and manganese in soil, from which the Baseline AQ NPMs were derived, are lower than the concentration of these metals measured in dustfall, thereby contributing to exceedances of the AQ Baseline NPM.
- Many metals in dust at control and impact sites and total dustfall at control sites were non detectable. Since total dustfall is used to derive metal concentrations in dust, and since "< DL" is replaced with half the detection limit to derive an assumed amount for dustfall, there is high uncertainty in the concentration of metals that were undetectable, particularly at control sites. This uncertainty affects the overall summary statistics and outcome of the comparisons to AQ NPMs, particularly for COPCs like lead and manganese where three or four samples, respectively, out of eight samples had concentrations below detection limit.

4.2.4 COMPARISON TO PREDICTED AQ NPMS

Table 4.2-3 shows the calculated PM_{10}-associated metal concentrations and the Predicted AQ NPM. When amounts of COPCs were not detectable in all eight samples, summary statistics were not calculated and concentrations are assumed to not exceed the Predicted AQ NPM.

The mean PM_{10}-associated concentrations of COPCs detectable in dust in 2023 were lower than the Predicted AQ NPMs for aluminum and iron, but higher than the Predicted AQ NPMs for lead and manganese by up to 6 times. The same reasons described in the previous section for Baseline NPMs comparisons (Section 4.2.3) may also cause the Predicted AQ NPMs to be exceeded, specifically:

- The predicted PM_{10} concentration of 11 µg/m^3 used to derive the Predicted AQ NPMs for off-site receptors is slightly less than the mean PM_{10} concentration of 11.2 µg/m^3 that was used to derive PM_{10}-associated metal COPC concentrations for the 2023 monitoring period.
- Predicted AQ NPMs were derived using predicted metals concentrations in soil from the *HHRA Update* report (Entia 2021, 2022a). Predicted metal concentrations in soil are not directly comparable to metal concentrations in dustfall. The predicted soil concentrations of aluminum, iron, lead, and manganese from which the Predicted AQ NPMs were derived are lower than measured concentrations in dustfall, thereby contributing to exceedances of the Predicted AQ NPM.
- Many metals in dust at control and near-field sites and total dustfall at Control sites were non detectable. Since total dustfall is used to derive metal concentrations in dust, and since "< DL" is replaced with half the detection limit to derive an assumed amount for dustfall, there is high uncertainty in the concentration of metals at control sites. This uncertainty affects the overall summary statistics and outcome of the comparisons to AQ NPMs.

4.2.5 STATISTICAL ANALYSIS

Figure 4.2-2 illustrates the estimated PM_{10}-associated COPC concentrations for COPCs that were detectable in dustfall, e.g., total aluminum, iron, lead, and manganese, at control and impact sites for Baseline (2022) and Construction (2023) periods. Since average 2023 concentrations of total lead and manganese exceeded the Baseline and Predicted AQ NPMs, these two COPCs were carried forward into a BACI analysis to determine whether observed changes in concentration at impact sites were significant in relation to changes in concentration at control sites.

Appendix C.1 provides the details of the BACI analysis. Results indicate that changes in lead concentrations in PM_{10} at impact sites from 2022 to 2023 were not significantly different (p = 0.56) from changes at control sites. However, the change in manganese concentrations in PM_{10} at impact sites from 2022 to 2023 were significantly different (p = 0.015) from changes at control sites. It is noted that because control sites (0.00887 ug/m^3) had higher concentrations of manganese in PM_{10} than impact sites (0.00542 ug/m^3) in 2023 (see Appendix C.1), these changes are not likely to be Mine-related.

4.3 SOIL QUALITY

4.3.1 SOIL QUALITY MONITORING RESULTS

4.3.1.1 PARTICLE SIZE

Analytical data for particle size are provided in Appendix A.2 in the COA from ALS. Summary statistics are provided in Table 4.3-1.

TABLE 4.3-1 STUDY AREA-WIDE SUMMARY STATISTICS FOR SOIL PH, PARTICLE SIZE, ORGANIC CARBON, AND INORGANIC CARBON, 2023

Parameter	n > DL	Summary Statistics of Parameter Concentrations in Soil, Study Area-wide (n = 42)							
		Minimum	Mean	Standard Deviation	Standard Error	95% UCLM	Median	95th Percentile	Maximum
Physical Tests

Sand (2.0 mm - 0.05 mm)	17	<1.0	28.2	26.7	5.45	38.9	34.1	62.7	86.7
Sand (2.0 mm - 0.063 mm)	36	<1.0	38.3	25.9	4.0	46.1	39.6	78.2	80.4
Silt (0.05 mm - 0.002 mm)	23	11.1	58.3	21.5	4.5	67.1	56.7	94.3	96.1
Clay (< 0.002 mm)	23	2.20	12.2	11.0	2.3	16.7	5.4	34.2	36.1
Silt (0.063 mm - 0.004 mm)	42	9.00	45.2	20.8	3.2	51.5	39.7	81.3	93.2
Clay (< 0.004 mm)	42	2.20	11.70	9.94	1.53	14.7	7.73	31.9	41.3
Organic / Inorganic Carbon									
Inorganic carbon	40	<0.05	0.155	0.162	0.0249	0.204	0.080	0.525	0.588
Total carbon	42	0.43	11.3	13.8	2.1	15.5	4.8	42.4	45.9
Total organic carbon	42	0.35	11.2	13.7	2.1	15.3	4.8	41.8	45.4
Inorganic carbon (as $CaCO_3$ equivalent)	40	<0.4	1.29	1.35	0.208	1.70	0.670	4.38	4.90
Organic matter	42	0.600	19.3	23.6	3.64	26.4	8.20	72.0	78.3

Notes:
Concentrations are provided in mg/kg dry weight, unless otherwise indicated.
N = number of samples; DL = detection limit; UCLM = upper confidence limit of the mean
For the purposes of calculating summary statistics, concentrations below the detection limit (DL) were replaced with 0.5 x DL.
"-" means that summary statistics, other than minimum and maximum, have not been calculated as more than 70% of samples were below DL.
Bold font with grey shading indicates the pH is outside of the guideline range from Canadian Council for Ministers of the Environment (CCME), which is 6 to 8. The guideline refers to the CCME Soil Quality Guidelines for the Protection of Environmental and Human Health, based on the lowest of the guidelines for agricultural or for residential / parkland land uses.

Figure 4.3-1 shows the percentage of clay (<0.004mm), silt (0.063mm to 0.004 mm), sand (2.0 mm to 0.063 mm), and gravel (>2 mm) at each site, grouped into subareas (control [far-], mid-, and near-field). Overall, soils consist of an average of 45% silt, 38% sand, 5% gravel, and 12% clay, but show a high degree of variability between sites, ranging from several sites consisting predominately of silt (e.g., CFMP-CV-019 and CFMP-CV-024) to a site with 37% gravel (CFMP-SV-005). There are no apparent differences in soil particle composition between subareas, and each subarea shows a high degree of heterogeneity between individual sites. Note that larger debris were not included in the soil particle size analysis as large pebbles and other debris are sorted out of the samples in the field.

4.3.1.2 ORGANIC AND INORGANIC CARBON

Soil organic and inorganic carbon analytical data are provided in Appendix A.2 in the COA from ALS. Summary statistics are provided in tables in Table 4.3-1.

As in baseline sampling in 2022, organic matter in 2023 was highly variable between sites (between 0.60 to 78 mg/kg, with a standard deviation of 23.6 mg/kg) as expected in a mountainous environment.

4.3.1.3 METALS AND PH

Soil analysis results are provided in Appendix A.2 in the COA from ALS.

pH (provided in Table 4.3-1) was low overall in the study area, with a minimum pH of 3.7, and a 95% UCLM pH of 5.9. Only the 95th percentile and maximum pH were within the CCME soil quality guideline range of 6 to 8, similar to observations during baseline studies in 2022 and 2021.

Summary statistics for concentrations of COPCs in the study area at sites listed in Table 3.2-1 are provided in table in Table 4.3-2. Box plots illustrating summary statistics (mean, percentile ranges, and potential outliers) for COPCs and pH at control, mid-field, near-field (impact) and road transect sites for baseline (2021 and 2022) and monitoring (2023) periods are shown in Figures 4.3-2 to 4.3-4. Selenium was not included in the box plots because concentrations were below the detection limit of 0.2 mg/kg in more than 70% of samples.

Two metal parameters had detection limits that were higher than guidelines or standards, but are not COPCs based on the *HHRA Update* report (Entia 2021, 2022a): The DL for boron (5 mg/kg) was higher than the CCME soil quality guideline or BC CSR standard of 2 mg/kg; boron was below the DL in most (39 of 42) soil samples (Appendix A.2). The DL for sulfur was 1,000 mg/kg, which was also greater than the CCME soil quality guideline of 500 mg/kg, and 35 out of 42 soil samples tested for sulfur had concentrations less than the DL.

As 2023 is considered the first year of Construction phase, the following sections compare the mean COPC concentrations in soil to the soil quality (SQ) Guideline, Baseline, and Predicted NPMs as outlined in the CFMP and the HHTAM report (ERM 2023f).

4.3.2 COMPARISON TO SQ GUIDELINE NPMS

Table 4.3-2 provides summary statistics for COPC concentrations in soil across the CFMP study area and the comparison to the SQ Guideline NPM. As shown in Table 4.3-2, mean concentrations of all COPCs were below the SQ Guideline NPMs.

TABLE 4.3-2 STUDY AREA-WIDE SUMMARY STATISTICS FOR COPC CONCENTRATIONS IN SOIL AND COMPARISON TO SQ GUIDELINE NPMS, 2023

COPC	n > DL	Summary Statistics of COPC Concentrations in Soil 2023, Study Area-wide (n = 42 mg/kg dw)								SQ Guideline NPM (mg/kg dw)
		Minimum	Mean	Standard Deviation	Standard Error	95% UCLM	Median	95th Percentile	Maximum	
Aluminum	42	179	13346	7264	1121	15543	12700	23375	36600	40000
Antimony	41	<0.10	0.346	0.213	0.033	0.411	0.290	0.838	0.980	20
Arsenic	42	0.160	6.92	9.01	1.39	9.64	3.98	**32.4**	**38.8**	12
Beryllium	38	<0.10	0.420	0.321	0.050	0.517	0.340	1.24	1.62	75

Chromium	40	<0.50	16.3	10.3	1.60	19.4	15.3	32.7	50.8	220
Cobalt	42	0.360	6.05	4.12	0.635	7.29	5.81	10.7	24.1	25
Copper	42	2.01	10.98	6.32	0.97	12.9	9.26	21.9	35.6	1100
Iron	42	374	19413	9511	1468	22290	19850	33810	**43400**	35000
Lead	42	0.690	9.13	19.7	3.03	15.1	6.13	12.8	**132**	120
Lithium	37	<2.0	6.48	3.69	0.569	7.60	6.03	13.11	16.6	65
Manganese	42	45.4	777	705	109	990	663	1713	4010	10000
Mercury	42	0.00950	0.0447	0.0298	0.00460	0.0537	0.0387	0.115	0.123	6.6
Molybdenum	42	0.375	1.321	1.145	0.177	1.67	0.805	3.75	5.04	10
Nickel	41	<0.50	11.07	9.54	1.47	14.0	8.95	21.4	58.6	200
Selenium	9	<0.05	-	-	-	-	-	-	0.410	80
Thallium	33	<0.050	0.0836	0.0532	0.00821	0.100	0.0780	0.171	0.307	1.0
Zinc	41	<2.0	55.4	36.3	5.60	66.4	49.6	120	156	10000

Notes:
COPC = contaminant of potential concern; n = number of samples; DL = detection Limit; UCLM = upper confidence limit of the mean; SQ = soil quality; NPM = Numeric Performance Metric; dw = dry weight
Data from all sites sampled in 2023, including CFMP-SV-041 to CFMP-SV-046, were used in calculation of summary statistics in this table.
"-" means that summary statistics, other than minimum and maximum, have not been calculated as more than 70% of samples were < DL.
Bold font with grey shading means concentration was higher than the SQ Guideline NPM.

FIGURE 4.3-1 RESULTS OF THE PARTICLE SIZE ANALYSIS FOR SOIL, 2023

CLIENT: BW Gold LTD.
GRAPHICS NUMBER: BWG-24ERM-006

FIGURE 4.3-2 CONCENTRATION OF ALUMINUM, ANTIMONY, ARSENIC, BERYLLIUM, CADMIUM AND CHROMIUM IN SOIL IN THE STUDY AREA AND SUBAREAS FOR BASELINE (2021/2022) AND CONSTRUCTION (2023)

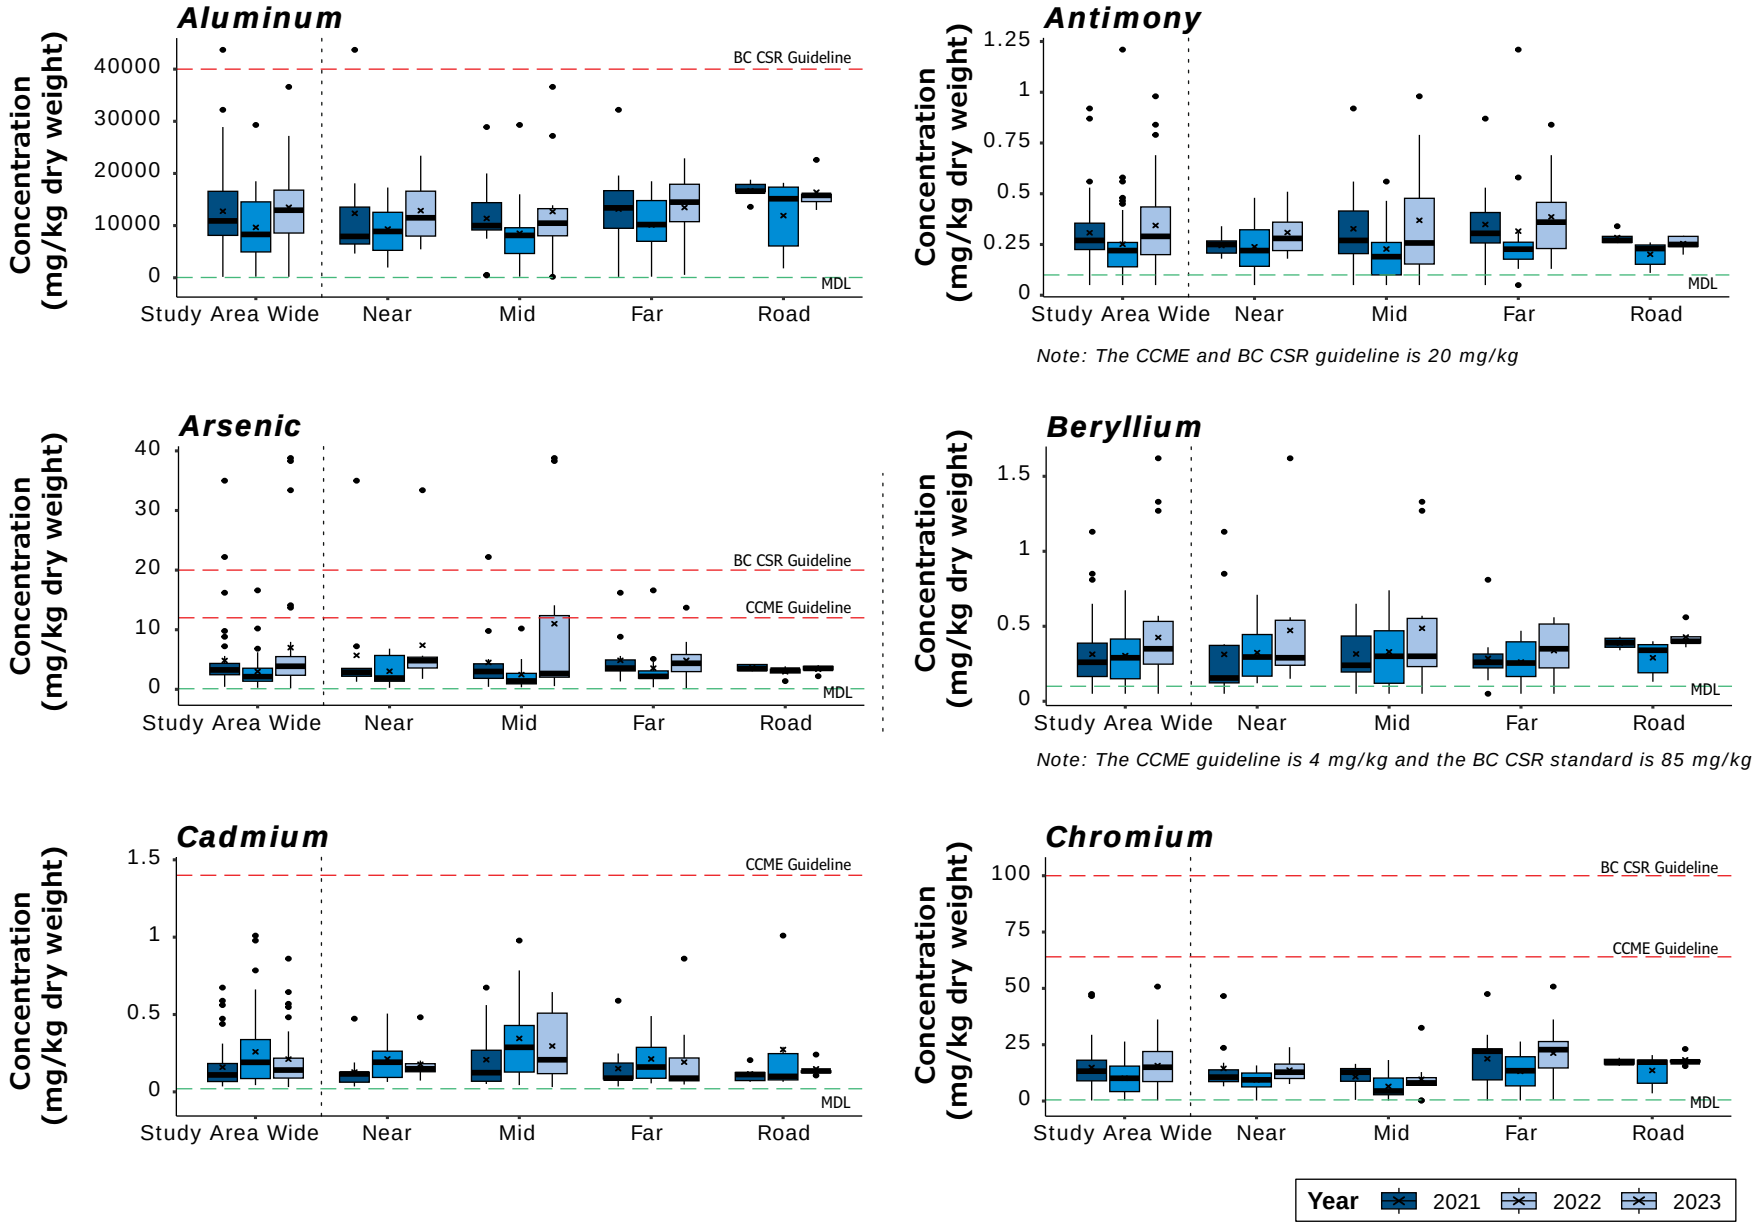

FIGURE 4.3-3 CONCENTRATION OF COBALT, COPPER, IRON, LEAD, LITHIUM AND MANGANESE IN SOIL IN THE STUDY AREA AND SUBAREAS FOR BASELINE (2021/2022) AND CONSTRUCTION (2023)

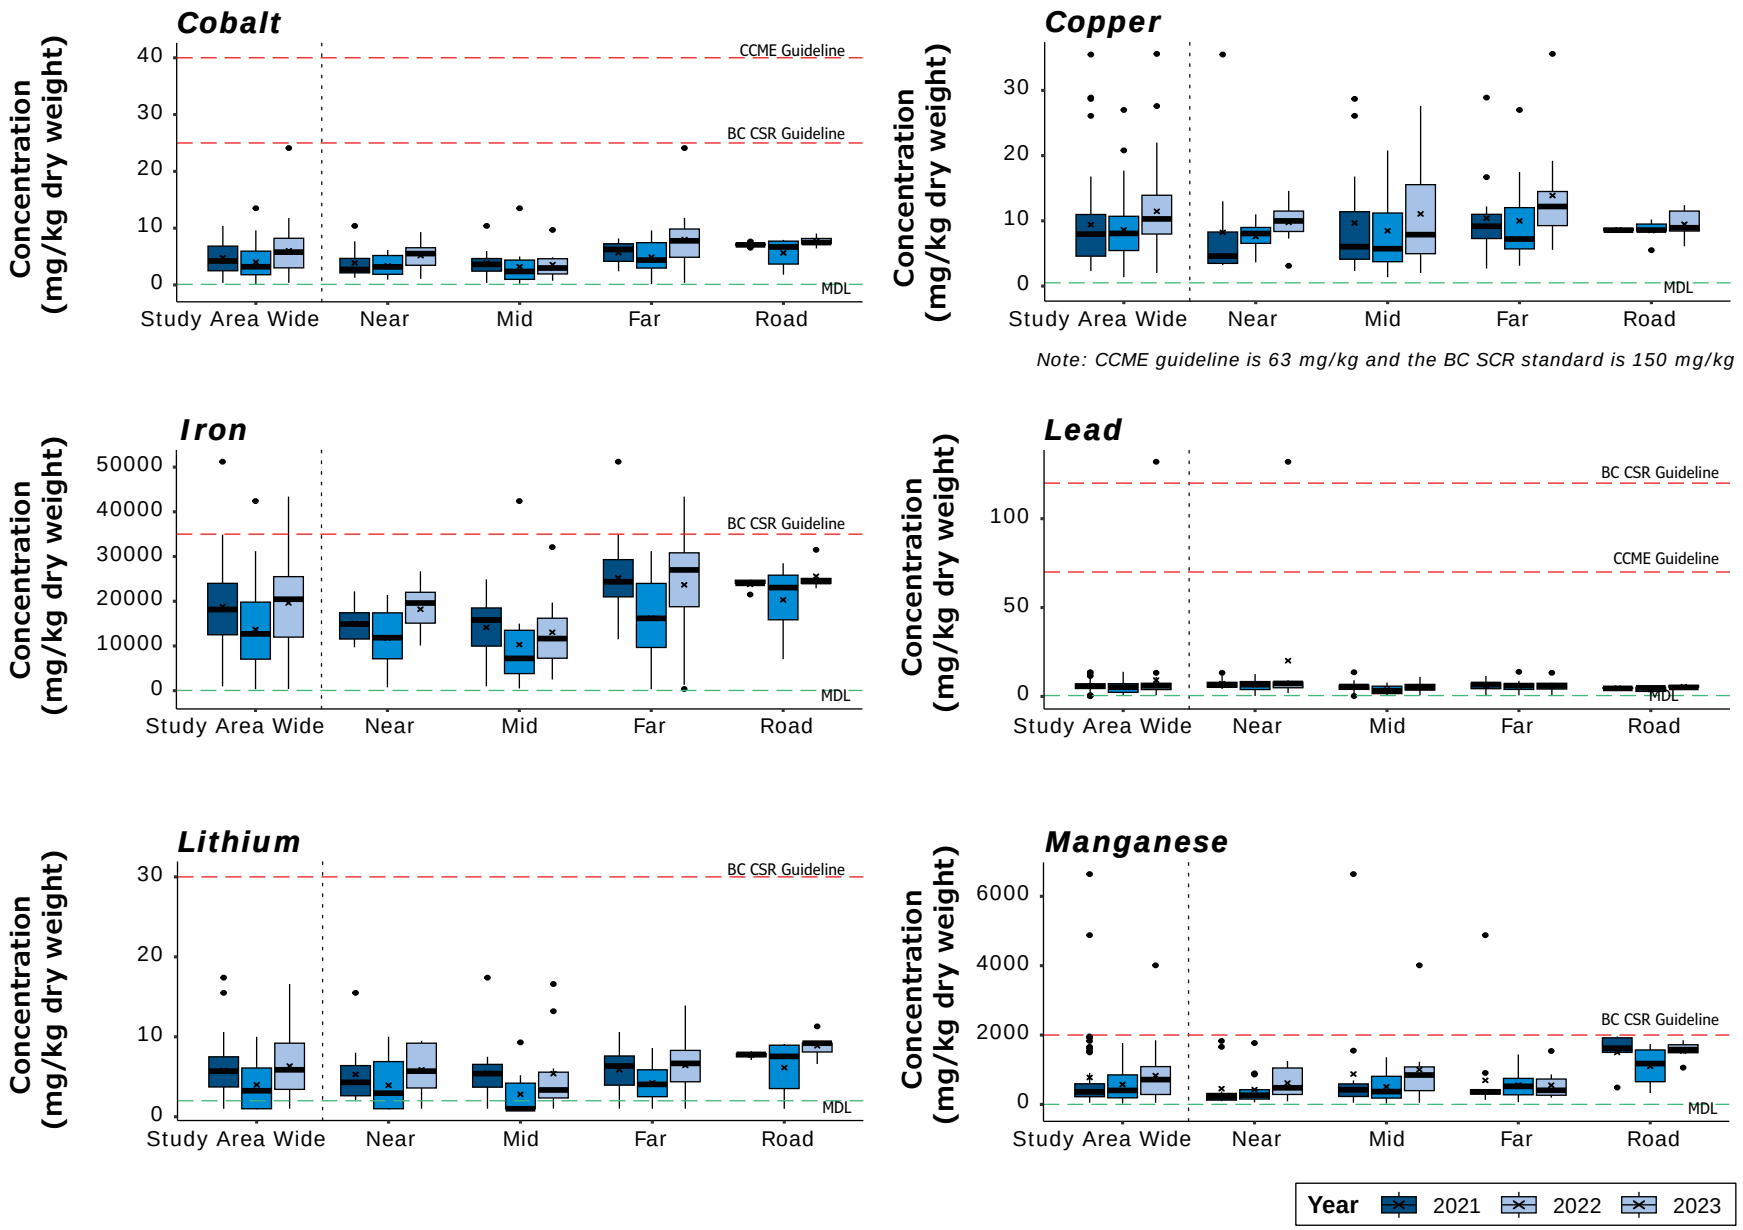
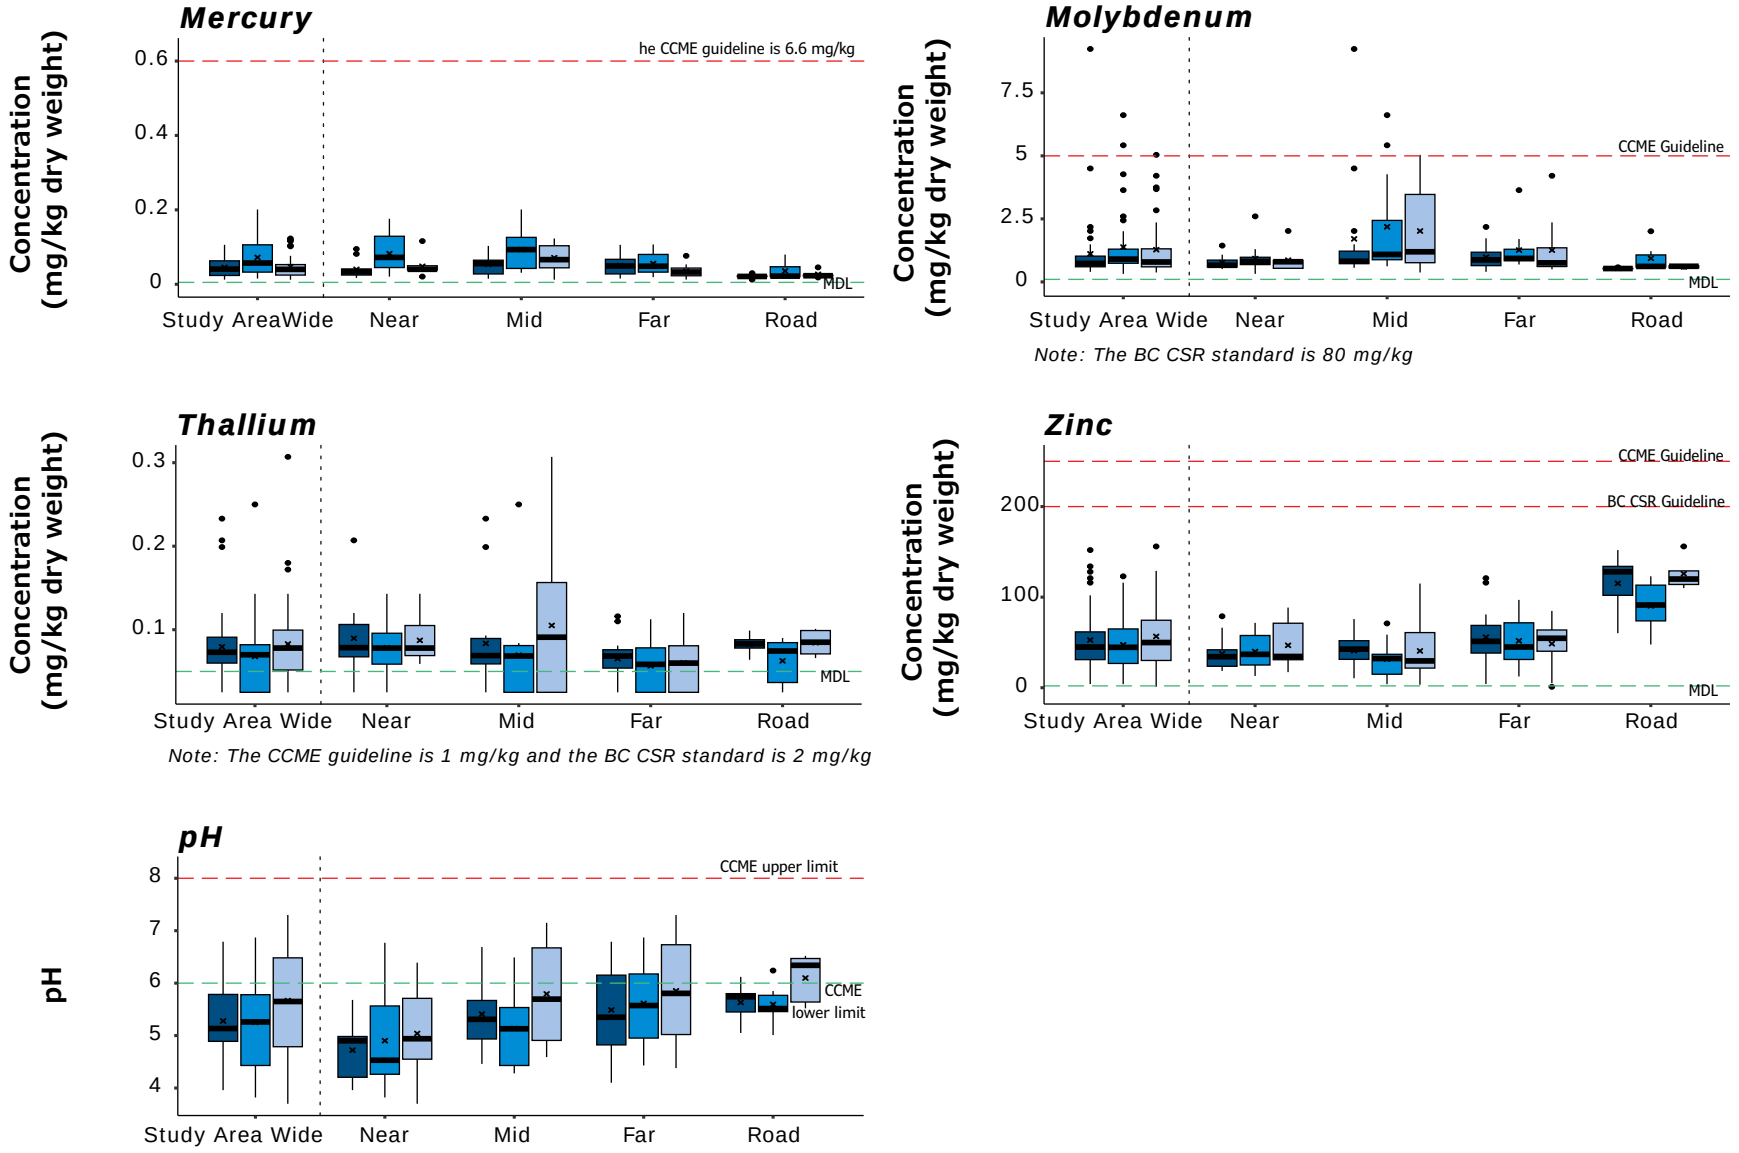


Note: CCME guideline is 63 mg/kg and the BC SCR standard is 150 mg/kg

FIGURE 4.3-4 CONCENTRATION OF MERCURY, MOLYBDENUM, THALLIUM, ZINC, AND PH IN SOIL IN THE STUDY AREA AND SUBAREAS FOR BASELINE (2021/2022) AND CONSTRUCTION (2023)



Only maximum concentrations of arsenic, iron, and lead were higher than the SQ Guideline NPMs, considering all monitoring sites across the CFMP study area. These higher concentrations are likely due to natural baseline heterogeneity in soil quality and not due to Mine activity as no single site experienced high concentrations of all (or most) COPCs. Iron and lead concentrations only exceeded SQ guideline NPMs at two control sites (CFMP-SV-011 and -034) and one near-field site (CFMP-SV-022), respectively. Arsenic concentrations exceeded the SQ Guideline NPM at one near-field site (CFMP-SV-006), four mid-field sites (CFMP-SV-001, -007, -028, and -046), and one control site (-008).

4.3.3 COMPARISON TO BASELINE SQ NPMS

The mean COPC concentrations in soil samples collected in 2023 were compared to the Baseline SQ NPMs derived in the HHTAM report (ERM 2023f). Sampling sites included in the derivation of Baseline SQ NPM concentrations from the 2021 and 2022 baseline sampling years were CFMP-SC-001 to CFMP-SV-040 and did not include the new mid-field sites collected in 2023. To be consistent, the 2023 dataset for this comparison excluded the sites that were only sampled in 2023 (i.e., mid-field sites CFMP-SV-041 to CFMP-SC-046), but not in 2021 and 2022, as continued sampling of these new mid-field sites is not recommended.

Summary statistics for this dataset are provided in Table 4.3-3 and the comparison between the mean concentration to the Baseline SQ NPMs are shown in Table 4.3-4. Mean concentrations of all COPCs did not exceed their Baseline SQ NPM concentrations in 2023.

4.3.4 COMPARISON TO PREDICTED SQ NPMS

The mean COPC concentrations in soil samples from 2023 were compared to the Predicted Soil NPMs derived in the HHTAM report (ERM 2023f), as shown in Table 4.3-4, using the same 2023 dataset as was used for comparison with Baseline SQ NPMs. Mean concentrations of COPCs did not exceed the Predicted SQ NPM concentrations in 2023.

4.3.5 STATISTICAL ANALYSIS

As per the CFMP, a BACI analysis is only required when an increase in soil COPC concentrations above Baseline and Predicted NPMs is detected. A BACI analysis was not performed for the purposes of the CFMP adaptive management framework because the mean 2023 soil COPC concentrations across the CFMP study area did not exceed the Baseline SQ NPM, and the Predicted SQ NPM, and concentrations are not at levels of concern (i.e., less than SQ Guideline NP).

However, the data were interrogated for any potential trends between years or between subareas. This analysis was completed for two reasons. Firstly, with the wildfire that occurred in July immediately around the mine site, it was possible that changes in soil (or plant and berry, see Section 4.4.5) metal concentrations could have occurred and it would be important to identify any changes from baseline. Second, with the initiation of small mammal sampling in 2023 (see Section 4.7) and with the expectation that there would be limited effects of the Mine on soil and vegetation in 2023 (ERM 2023d), the intent was to incorporate 2023 sampling results for soil, vegetation, and small mammals into the 2021-2022 baseline dataset.

TABLE 4.3-3 STUDY AREA-WIDE SUMMARY STATISTICS FOR COPC CONCENTRATIONS IN SOIL NOT INCLUDING SITES CFMP-SV-041 TO CFMP-SV-046, 2023

COPC	n > DL	Summary Statistics of COPC Concentrations in Soil, Study Area-wide (n = 36; mg/kg dw)							
		Minimum	Mean	Standard Deviation	Standard Error	95% UCLM	Median	95th Percentile	Maximum
Aluminum	36	179	13504	7813	1302	16056	12950	24350	36600

Lead	9.16	9.9	10
Lithium	6.34	8.9	8.9
Manganese	830	1413	1435
Mercury	0.0471	0.11	0.11
Molybdenum	1.28	2.5	2.5
Nickel	11.4	15	15
Selenium	0.145	0.27	0.35
Thallium	0.0828	0.13	0.13
Zinc	56.7	89	93

Notes:
COPC = contaminant of potential concern; SQ = soil quality; NPM = Numeric Performance Metric; dw = dry weight

The statistical comparisons for soil were carried out using a linear mixed-effects model to compare between years (or site classification) while controlling for repeated measurements across sites. To control for multiple testing, a false-discovery rate correction (Benjamini and Hochberg, 1995) was applied and each test was assessed relative to an alpha of 0.05 using the adjusted p-values. The intraclass correlation coefficient (average correlation among measurements from the same site) was estimated using linear mixed-effects models with site ID as a random effect. Because of small samples sizes, the random effects model sometimes had a singular fit, and so the intraclass correlation coefficient was not calculable for all comparisons. Where the fit was singular, the random effects were removed and a linear model was fit instead.

On a study-area-wide basis as well as on a subarea basis, there were no consistent trends among COPC concentrations in soil discernable from box plots of the data (Figure 4.3-2). This was confirmed by statistical comparisons using a linear mixed effects model with log-transformed data as described in Section 3.8. Summary statistics COPC concentrations in soil for control and near-field (impact) subareas are provided in Tables 4.3-5 and 4.3-6, respectively. Results of the statistical analyses are presented in Appendix C, Tables C.1-1 and C.1-2. There were no statistically significant differences in COPC concentrations in soil between the 2021-2022 cumulative baseline and 2023 ($p > 0.05$).

A comparison of 2023 COPC concentrations between control and near-field (impact) sites showed that there are no significant differences in soil COPC concentrations between these subareas ($p > 0.05$; Appendix Table C.1-3) indicating that there are no detectable effects from the Mine on soil quality.

4.4 PLANT AND BERRY QUALITY

4.4.1 PLANT AND BERRY MONITORING RESULTS

Analytical data for plant and berry samples analyzed in 2023 are provided in Appendix A.2 in the COA from ALS. For compiling summary statistics in the report, samples were grouped into leafy vegetation consisting of willow, sedge, and Labrador tea. No summary statistics were calculated for 2023 berry samples as only two samples were obtained (see Section 3.3.1). Berries were generally sparse likely due to dry climatic conditions. This is similar to the conditions observed in 2022 and abundance of berries in the study area appeared to have declined further in 2023.

Summary statistics for the study area and by subarea for willow, sedge, and Labrador tea samples collected in 2023 are provided in tables in Appendix C (except for willow at near-field and control subareas, which are provided in Section 4.4.5).

The following sections compare the mean COPC concentrations in leafy vegetation to the country foods (CF) guideline, Baseline, and Predicted NPMs for vegetation defined in the CFMP and the HHTAM report (ERM 2023f).

4.4.2 COMPARISON TO CF GUIDELINE NPMS

Table 4.4-1 provides summary statistics for COPC concentrations in plants (leafy vegetation of willow, sedge, and Labrador tea) across the CFMP study area. Table 4.4-2 shows the concentrations measured in two berry samples collected at CFMP-SV-001 and -006. Table 4.4-1 also includes a comparison of concentrations to the CF Guideline NPMs for plants.

As shown in Table 4.4-1, mean concentrations of all COPCs in plants were below the CF Guideline NPMs. Maximum and 95% percentile concentrations of aluminum, cadmium, cobalt, and iron, and the maximum concentrations of arsenic, lead, manganese, molybdenum, nickel, thallium, and zinc were higher than the CF Guideline NPMs. These higher concentrations are likely due to natural baseline heterogeneity in plant quality and not due to Mine activity, as no single site experienced high concentrations of all (or most) COPCs.

TABLE 4.3-5 CONTROL SUBAREA SUMMARY STATISTICS FOR COPC CONCENTRATIONS IN SOIL, 2023

COPC	n > DL	Summary Statistics of COPC Concentrations in Soil, Control Subarea (n = 12 mg/kg dw)							
		Minimum	Mean	Standard Deviation	Standard Error	95% UCLM	Median	95th Percentile	Maximum
Aluminum	12	552	13449	7404	2137	17638	14500	22790	22900
Antimony	12	0.130	0.386	0.213	0.062	0.506	0.360	0.758	0.840

Notes:
COPC = contaminant of potential concern; n = number of samples; DL = detection limit; UCLM = upper confidence limit of the mean; CF = country foods; NPM = Numeric Performance Metric; ww = wet weight
Data from all sites sampled in 2023, including CFMP-SV-041 to CFMP-SV-046, were used in calculation of summary statistics in this table.
Bold font with grey shading means that concentrations were higher than the CF Guideline NPM.
"-" means that summary statistics, other than minimum and maximum, have not been calculated as more than 70% of samples were below DL.

TABLE 4.4-2 STUDY AREA-WIDE CONCENTRATIONS OF COPCS IN BERRIES AND COMPARISON TO CF GUIDELINE NPMS FOR BERRIES, 2023

COPC	006-HUCK	001-HUCK	CF Guideline NPM for Berries (mg/kg ww)
	Near-field	Mid-field	
Aluminum	11.6	2.7	49
Antimony	0.00110	0.00076	0.050
Arsenic	**0.975**	0.010	0.027
Beryllium	0.00110	0.00076	0.55
Cadmium	0.00526	0.00038	0.21
Chromium	0.0219	0.011856	0.35
Cobalt	0.00548	0.00152	0.06
Copper	1.86	0.76	30
Iron	16.6	2.7	46
Lead	0.0374	0.0038	0.11
Lithium	0.0548	0.0380	0.40
Manganese	39.2	27.4	332
Mercury	0.000548	0.000380	0.026
Molybdenum	0.0493	0.0445	1.8
Nickel	0.103	0.0350	2.2
Selenium	0.0110	0.0038	0.28
Thallium	0.000219	0.000152	0.0056
Zinc	3.02	0.877	30

Notes:
COPC = contaminant of potential concern; n = number of samples; CF = country foods; NPM = Numeric Performance Metric; ww = wet weight.
Bold font with grey shading means concentrations greater than the CF Guideline NPM.

As only two berry samples were collected in 2023, individual sample concentrations, instead of the mean concentration, were compared with the CF Guideline NPM. The arsenic concentration in the first huckleberry sample (0.010 mg/kg ww from CFMP-SV-001) was well below the CF Guideline NPM of 0.027 mg/kg ww. However, the concentration of arsenic (0.975 mg/kg ww from CFMP-SV-006) in the second huckleberry sample was greater than the CF Guideline NPM of 0.027 mg/kg ww for berries (Table 4.4-2). Arsenic concentrations in berries have generally been very low (0.014 mg/kg ww average, with a maximum of 0.097 mg/kg ww in 2021-2022; n = 83) (ERM 2023b), or not detectable. The concentration of 0.975 mg/kg in the huckleberry sample from CFMP-SV-006 was confirmed by re-assessment (in duplicate) by ALS on January 16, 2024, so was not a result of a laboratory issue. It is, therefore, likely that the high arsenic concentration measured in sample 006-HUCK is an outlier and may be due to contamination or dusting (e.g., wildfire-related dust settling on berries), as station CFMP-SV-006 is located at the southern limit of the 2023 Davidson Creek wildfire.

4.4.3 COMPARISON TO BASELINE PLANT AND BERRY NPMS

The mean COPC concentrations in plant samples collected in 2023 were compared to the Baseline Plant NPMs derived in the HHTAM Report (ERM 2023f). Similar to soils, sampling sites included in the derivation of Baseline Plant NPM concentrations from the 2021 and 2022 baseline sampling years were CFMP-SC-001 to CFMP-SV-040. As such, the 2023 dataset for this comparison excluded any sites that were only sampled in 2023, but not in 2021 and 2022, namely mid-field sites CFMP-SV-041 to CFMP-SC-046. Summary statistics for this dataset are provided in Table 4.4-3. The comparison between the mean concentration of COPCs measured in 2023 to the Baseline Plant NPMs are shown in Table 4.4-4. Mean concentrations of COPCs did not exceed the Baseline Plant NPM concentrations in 2023. As only two berry samples were collected in 2023, the mean could not be calculated and compared to the Baseline Berry NPM.

4.4.4 COMPARISON TO PREDICTED PLANT AND BERRY NPMS

The mean COPC concentrations in plant samples from 2023 were compared to the Predicted Plant NPMs derived in the HHTAM report (ERM 2023f). Comparison of the mean concentration from samples collected across the study area not including the new mid-field sites CFMP-SV-041 to -046 to the Predicted Plant NPMs are shown in Table 4.4-4. Mean concentrations of COPCs did not exceed the Predicted SQ NPM concentration in 2023. As only two berry samples were collected in 2023, the mean could not be calculated and compared to the Predicted Berry NPM.

4.4.5 STATISTICAL ANALYSIS

As per the CFMP, a BACI analysis is only required when an increase in plant and berry COPC concentrations above baseline and predicted concentrations is detected. A BACI analysis was not performed for plants because the mean 2023 COPC concentrations in leafy vegetation did not exceed the CF Guideline NPM, Plant Baseline NPM, and the Predicted Plant NPM and there were insufficient berry samples available for this analysis.

However, data were interrogated for any potential trends between years or between subareas. This analysis was completed for two reasons. Firstly, with the wildfire that occurred in July immediately around the mine site, it was possible that changes in plant and berry metal concentrations could have occurred and it would be important to identify any changes from baseline. Second, with the initiation of small mammal sampling in 2023 (see Section 4.7) and with the expectation that there would be limited effects of the Mine on vegetation in 2023 (ERM 2023d), the intent was to incorporate 2023 sampling results for soil, vegetation, and small mammals into the 2021-2022 baseline dataset.

Box plots illustrating summary statistics (mean, percentile ranges, and potential outliers) for the different subareas as well as study area-wide for baseline and monitoring periods are presented in Figure 4.4-1 and 4.4-2 for willow and in Appendix E.1 and E.2 for Labrador tea and sedge.

TABLE 4.4-3 STUDY AREA-WIDE SUMMARY STATISTICS FOR COPC CONCENTRATIONS IN PLANTS NOT INCLUDING SITES CFMP-SV-041 TO CFMP-SV-046, AND COMPARISON TO CF GUIDELINE NPMS, 2023

COPC	n > DL	Summary Statistics of COPC Concentrations in Leafy Vegetation, Study Area-wide (n = 71; mg/kg ww)							
		Minimum	Mean	Standard Deviation	Standard Error	95% UCLM	Median	95th Percentile	Maximum

Notes:
COPC = contaminant of potential concern; n = number of samples; DL = detection limit; UCLM = upper confidence limit of the mean; CF = country foods; NPM = Numeric Performance Metric; ww = wet weight
Data from all sites sampled in 2023 except CFMP-SV-041 to CFMP-SV-046 were used in calculation of summary statistics in this table.
"-" means that summary statistics, other than minimum and maximum, have not been calculated as more than 70% of samples were below DL.

TABLE 4.4-4 COMPARISON OF COPC CONCENTRATIONS IN PLANTS TO BASELINE AND PREDICTED PLANT NPMS, 2023

COPC	Mean Concentration in Plants (mg/kg ww)	Baseline Plant NPM (mg/kg ww)	Predicted Plant NPM (mg/kg ww)
Aluminum	28.0	45	45
Antimony	0.00227	0.0094	0.010
Arsenic	0.0297	0.096	0.13
Beryllium	0.00283	0.012	0.0125
Cadmium	0.312	0.98	1.0
Chromium	0.0415	0.14	0.15
Cobalt	0.172	0.65	0.67
Copper	1.12	5.7	8.5
Iron	49.9	129	132
Lead	0.0244	0.17	0.18
Lithium	0.103	0.43	0.43
Manganese	278	963	978
Mercury	0.00474	0.014	0.014
Molybdenum	0.715	3.5	3.6
Nickel	0.273	1.2	1.2
Selenium	0.0114	0.097	0.13
Thallium	0.000750	0.0078	0.0080
Zinc	27.2	98	105

Notes:
COPC = contaminant of potential concern; NPM = Numeric Performance Metric; ww = wet weight

Because willow is widely distributed throughout the study area, it has been collected consistently at each soil and vegetation sampling site for three years (except for CFMP-SV-001, -004, and -017 in 2023, see Sections 3.2.1 and 3.3.1) for a total of 109 samples. Thus, statistical power (see ERM 2023b) and statistical comparisons are more reliable for willow than for other species collected under the CFMP (i.e., Labrador tea, sedge, or berries). Statistical analysis results tables are presented for Labrador tea and sedge (Appendix Tables C.2-4, C.2-5, and C.2-6), but the discussion will focus on the results for willow.

FIGURE 4.4-1 CONCENTRATION OF ALUMINUM, ARSENIC, CADMIUM AND COBALT IN WILLOW SAMPLES IN THE STUDY AREA AND SUBAREAS FOR BASELINE (2021/2022) AND CONSTRUCTION (2023)

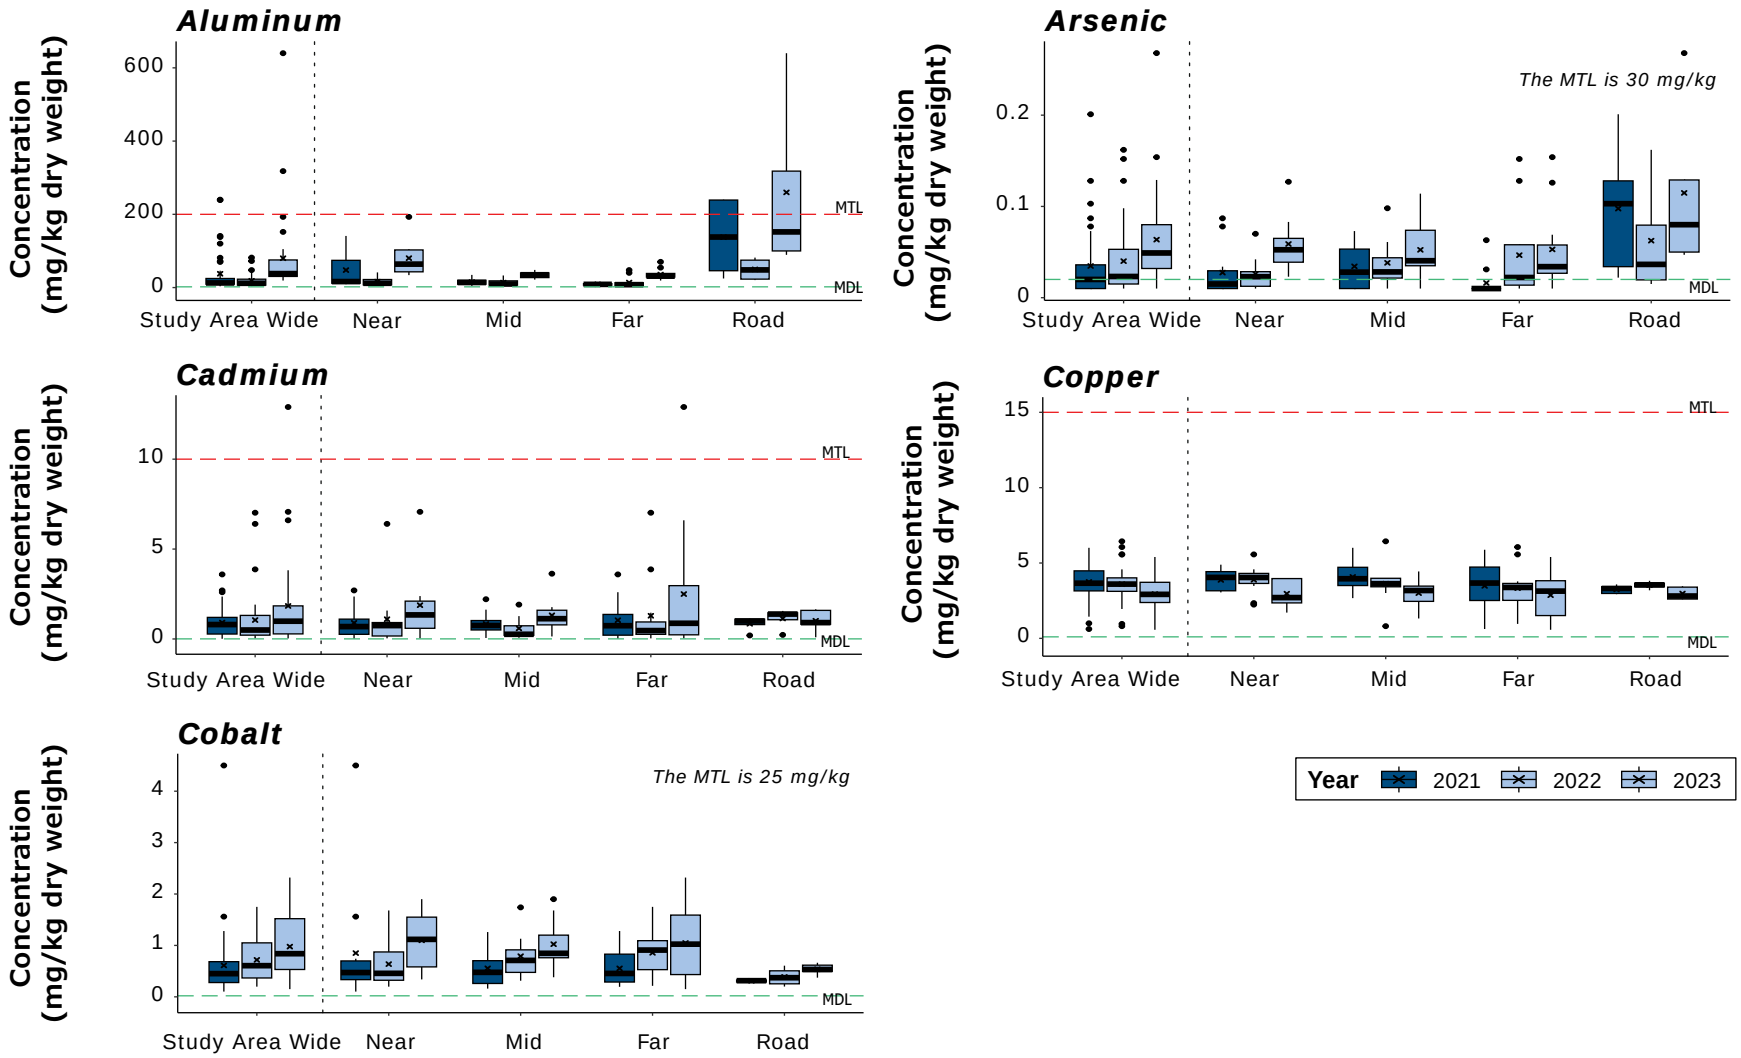

FIGURE 4.4-2 CONCENTRATION OF IRON, MANGANESE, MOLYBDENUM, MERCURY, AND ZINC IN WILLOW SAMPLES IN THE STUDY AREA AND SUBAREAS FOR BASELINE (2021/2022) AND CONSTRUCTION (2023)

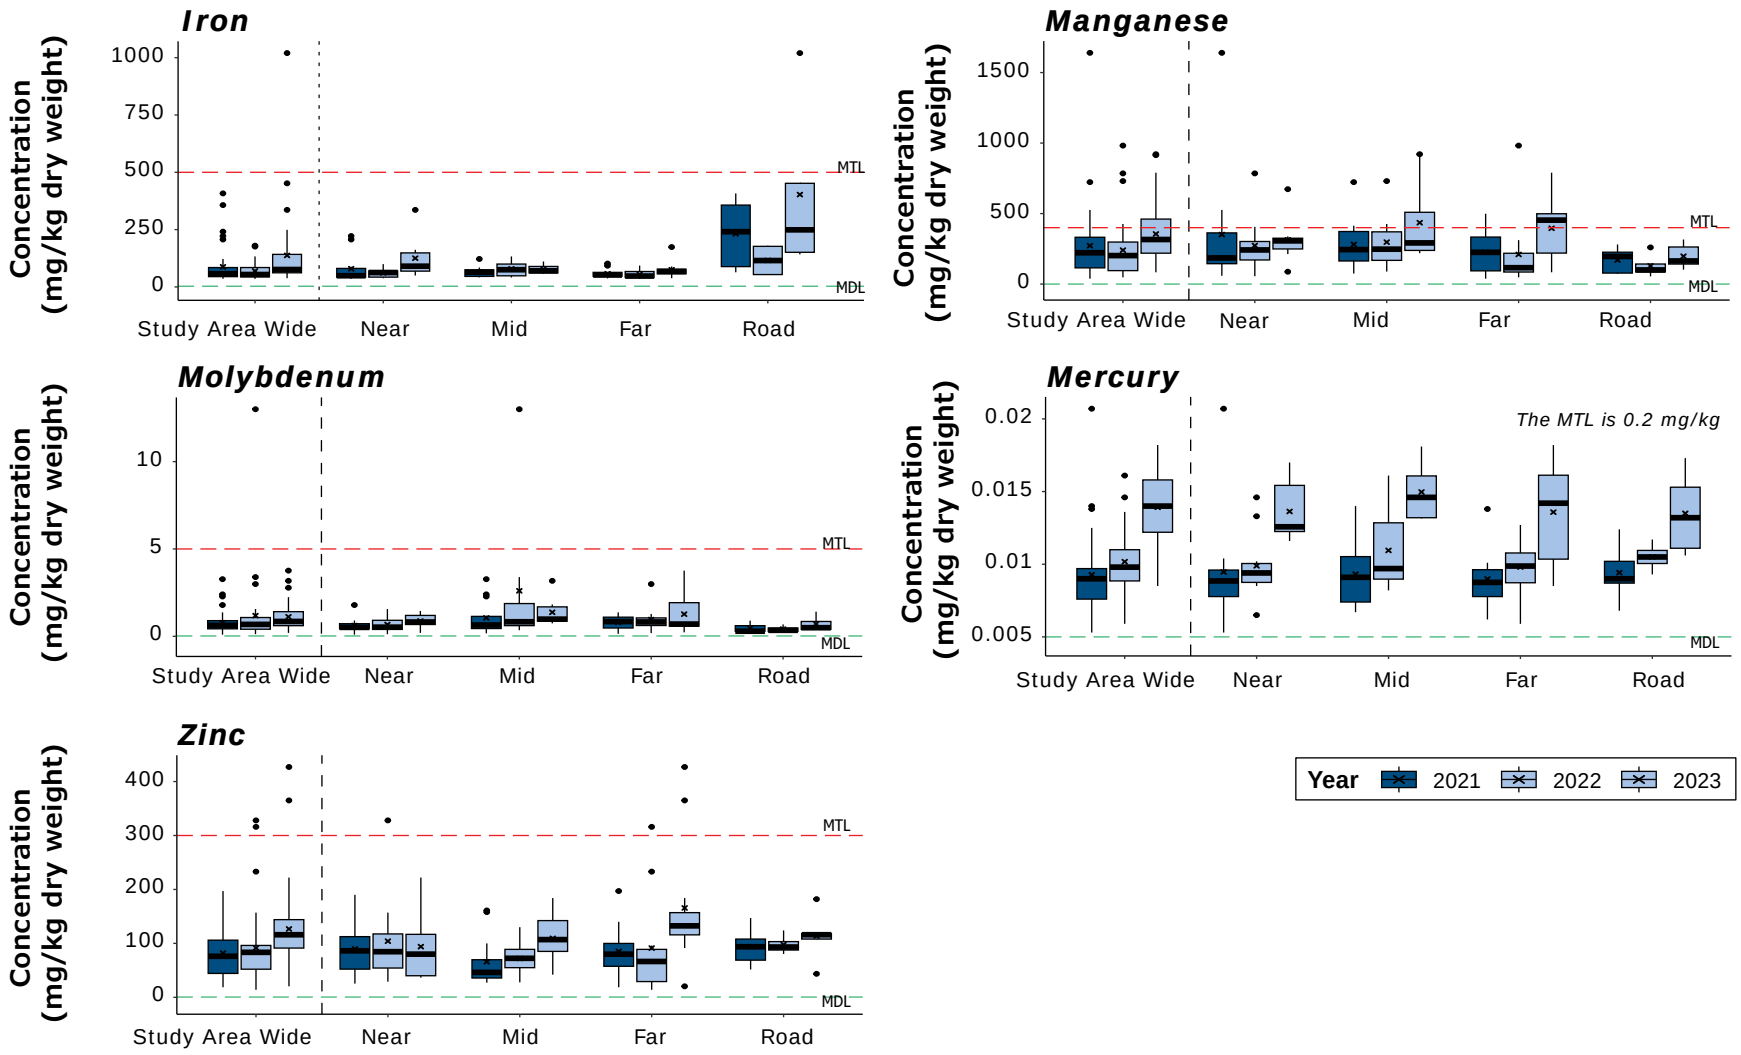

Using a linear mixed effects model with log-transformed data as described in Sections 3.8.2 and 4.3.5, on a study area-wide basis there are several statistically significant differences in COPC concentrations in willow tissues between baseline collection years (2021/2022) and monitoring year 2023 (Appendix Table C.2-4). Out of the COPCs with a detection rate of greater than 30% (i.e., fewer than 70% non-detects), the analysis showed an increasing trend for concentrations of aluminum, arsenic, cobalt, iron, manganese, mercury, molybdenum, and zinc, whereas copper decreased, and cadmium had no significant change ($p < 0.05$). However, only aluminum has an effects ratio higher than 100% (doubling) across the study area. This increase (> 100%) in aluminum is also observed in Labrador tea and sedge (Appendix Table C.2-4). The increase in aluminum in the three species is observable in all subareas and, thus, is unlikely an effect of Mine construction activities (Appendix Table C.2-5). Because of the statistically significant differences in tissue concentrations of COPCs, it is not recommended to include the 2023 vegetation data in the cumulative 2021-2022 baseline.

Table 4.4-5 and 4.4-6 present the summary statistics for willow samples collected in 2023 for near-field (impact) and control subareas, respectively. A comparison of 2023 COPC concentrations between control and near-field (impact) sites for willow samples (Appendix Table C.2-6) showed that there are no significant differences in willow tissue COPC concentrations between these subareas, except for aluminum. The mean aluminum concentration at near-field sites (80.6 mg/kg ww) is significantly higher than the mean aluminum concentration at control sites (35.5 mg/kg ww) at a significance level of 0.05. During baseline sampling in 2021, a similar trend was observed between means in aluminum concentration at near-field (51.0 mg/kg ww) and control (9.1 mg/kg ww) sites; however this difference was not found to be significant using a non-parametric (Kruskal-Wallis) test and a significance level of 0.001 (Bonferroni correction), and was not observed in samples in 2022 (near-field site mean of 16 mg/kg ww and control site mean of 15 mg/kg ww). It is likely that the observed difference in aluminum concentration between near-field and control sites is due to natural variation and not due to either Mine dust emissions or wildfire-related dusting.

4.5 SURFACE WATER

4.5.1 SURFACE WATER QUALITY MONITORING RESULTS

Tables for 2023 raw water quality data are located in Appendix A.3. Laboratory certificates of analysis from ALS are provided in the *2023 AEMP Interpretive Report* (ERM 2024). Raw data for October to December 2022 were provided in the *2022 CFMP Annual Report* (ERM 2023d) and *2022 AEMP Interpretive Report* (ERM 2023c). Box plots illustrating summary statistics (mean, percentile ranges, and potential outliers) for control and for impact sites for Baseline and Construction monitoring periods are located in Appendix E.3.

4.5.2 COMPARISON TO DRINKING WATER QUALITY GUIDELINE (DWQG) NPMS

Table 4.5-1 provides summary statistics for COPC concentrations for all monitoring sites (both control and impact sites) within the CFMP study area listed in Table 3.4-1 for the monitoring period between October 1, 2022 and December 31, 2023. The data from October to December 2022 were included in the summary statistics and NPM comparisons for the 2023 monitoring period as this was a period of only three months after Early Works Construction began and did not constitute a full year. As a result, reporting for water quality for 2023 includes 15 months of data.

TABLE 4.4-5 NEAR-FIELD SUBAREA SUMMARY STATISTICS FOR COPC CONCENTRATIONS IN WILLOW, 2023

COPC	n > DL	Summary Statistics for COPC Concentrations in Willow, Near-field Subarea (n = 8 mg/kg ww)							
		Minimum	Mean	Standard Deviation	Standard Error	95% UCLM	Median	95th Percentile	Maximum

Zinc	57	<0.0030	-	-	-	-	0.0630	3.0

Notes:
COPC = contaminant of potential concern; n = number of samples; DL = detection limit; 95% UCLM = 95% upper confidence limit of the mean; DWQG = drinking water quality guideline; NPM = Numerical Performance Metric; ng = no drinking water quality guideline or standard is available.
Concentrations measured to be less than the DL were replaced with concentrations of 0.5 x DL for the purpose of calculating summary statistics.
"-" means that summary statistics, other than minimum and maximum, have not been calculated as more than 70% of samples were below DL.
Data collected between October 1, 2022 and December 31, 2023 were included in the calculation of summary statistics.
The 95% UCLM was calculated using bootstrapping methods, which are free of parametric assumptions.
[a] Sites: DC-05, DC-10, DC-15, DC-20, 661-03, 661-04, 661-05, 661-10, 661-20, CC-03, CC-05, CC-10, CC-15, CC-20, CC-30, CC-40, 705-05, 705-10, TC-01, TC-05, TC-10, TC-15, and FC-01, TL-01, and KL-01.
[b] DWQG NPM = drinking water quality guideline or standard which is the lowest (most conservative) of the BC Contaminated Sites Regulation (B.C. Reg. 375/96) Schedule 3.2 Drinking Water Standards, the BC Source Drinking Water Guideline (BC ENV 2020b), and the Health Canada Drinking Water Quality Guideline (Health Canada 2022).
Bold font with grey shading means concentration greater than the DWQG NPM.

Table 4.5-1 includes a comparison to the DWQG NPM to identify if COPC concentrations in water at any of the CFMP sampling sites were higher than DWQGs or standards. As shown in Table 4.5-1, mean concentrations of all COPCs were below the DWQG NPMs.

Maximum concentration of total aluminum and manganese, considering all CFMP monitoring sites across the CFMP study area, were higher than the DWQG NPMs (Table 4.5-1).

Total manganese concentrations were higher than the DWQG NPM of 0.12 mg/L in two samples from Kuyakuz Lake (control) and five samples from impact sites: Tatelkuz Lake (n = 2), TC-10 (n = 1), CC-05 (n = 1), CC-40 (n = 1). All stream samples and one lake sample (KL-01) that exceeded the DWQG NPM were collected in May, whereas the other lake samples that exceeded the DWQG NPM were collected in February, August, and October.

The samples collected at CC-05 and CC-40 were collected as part of the spring freshet 5-in-30 sampling event in May 2023. When the average concentration across the 5 samples in 30 days is calculated for each site, the average concentration (0.061 mg/L at CC-05 and 0.063 mg/L at CC-40) is lower than the total manganese DWQG NPM (0.12 mg/L) at both sites.

There were no Mine related discharges or emissions to these creeks or to Tatelkuz Lake during the monitoring period. Therefore, the manganese concentrations measured in surface water samples are considered to be naturally occurring and are not associated with potential Mine effects.

Concentrations of total manganese exceeded the DWQG NPM at the KL-01 site during baseline studies between January 2016 and September 2022 in 11 of 23 samples (including two field duplicate samples; ERM 2023h). As this is a control site located in Kuyakuz Lake upstream of the Mine and the baseline dataset indicates total manganese concentrations were regularly higher than the DWQG NPM, the elevated total manganese concentrations are naturally occurring and not due to Mine activities.

Total aluminum concentrations were higher than the DWQG NPM of 2.9 mg/L in only one sample obtained from 661-05 in November 2023 (3.39 mg/L). The duplicate of that sample had a concentration of 2.71 mg/L. This is likely an anomaly as the average of all samples (n = 13) obtained at 661-05 during the monitoring period was 0.56 mg/L. There are currently no Mine related discharges or emissions to Creek 661 and, therefore, the aluminum concentrations measured in surface water samples are considered to be naturally occurring and are not associated with potential Mine effects.

4.5.3 SUMMARY OF COPC CONCENTRATIONS AT CONTROL SITES

The following water quality sampling sites are control sites as they are located either upstream of the Mine or in a watershed that is separate from the Mine (Table 3.4-1): KL-01, CC-03, 661-01, 705-05, 705-10, TC-01, and FC-01. Table 4.5-2 provides summary statistics for COPC concentrations at these control sites for the monitoring period.

Mean concentrations of all COPCs were below the DWQG NPMs. The maximum concentration of total manganese exceeded the DWQG NPM at two control sites, specifically at KL-01 and 661-01. As these are control sites, concentrations of total manganese higher than the DWQG NPM are naturally elevated and are not elevated due to the Mine.

TABLE 4.5-2 CONTROL SUBAREA SUMMARY STATISTICS OF COPC CONCENTRATIONS IN SURFACE WATER, 2023

COPC	n > DL	Summary Statistics of COPC Concentrations in Surface Water, Control Subarea[a] (n = 160; mg/L)						DWQG NPM [b] (mg/L)
		Minimum	Mean	Median	95% UCLM	95th Percentile	Maximum

Notes:
COPC = contaminant of potential concern; n = number of samples; DL = detection limit; 95% UCLM = 95% upper confidence limit of the mean; ng = no drinking water quality guideline or standard is available.
Data collected between October 1, 2022 and December 31, 2023 were included in the calculation of summary statistics.
Concentrations measured to be less than the DL were replaced with concentrations of 0.5 x DL for the purpose of calculating summary statistics.
"-" means that summary statistics, other than minimum and maximum, have not been calculated as more than 70% of samples were below DL.
The 95% UCLM was calculated using bootstrapping methods, which are free of parametric assumptions.
[a] Sites: 661-01, CC-03, 705-05, 705-10, TC-01, FC-01, and KL-01.
[b] DWQG NPM = drinking water quality guideline or standard numeric performance objective which is the lowest (most conservative) of the BC Contaminated Sites Regulation (B.C. Reg. 375/96) Schedule 3.2 Drinking Water Standards, the BC Source Drinking Water Guideline (BC ENV 2020b), and the Health Canada Drinking Water Quality Guideline (Health Canada 2022).
Bold font and grey shading denote mean concentrations greater than the DWQG NPM.

4.5.4 COMPARISON OF COPC CONCENTRATION AT POTENTIAL IMPACT SITES TO DWQG NPMS AND BASELINE WQ NPMS

The following sites are potential impact sites as they are located downstream of the Mine (Table 3.4-1): DC-05, DC-10, DC-15, DC-20, 661-03, 661-04, 661-05, 661-10, 661-20, TL-01, CC-05, CC-10, CC-15, CC-20, CC-30, CC-40, TC-05, TC-10- and TC-15. Table 4.5-3 provides summary statistics for COPC concentrations for these impact sites for the monitoring period, with a comparison to the DWQG NPM and the Baseline WQ NPM.

Mean concentrations of all COPCs at impact sites were lower than the DWQG NPM during the monitoring period. Similar to statistics calculated for control sites for the monitoring period (Section 4.5.3 and Table 4.5-2), the maximum concentration of total manganese (0.253 mg/L) was higher than the DWQG NPM (0.12 mg/L). Total manganese exceeded the DWQG NPM in Tatelkuz Lake (n = 2), Turtle Creek (TC-10, n = 1), and Chedakuz Creek (CC-05 and CC-40, n = 2). Total aluminum was higher than the DWQG NPM of 2.9 mg/L in one sample from 661-05 (3.39 mg/L in November 2023), which was approximately 30 times higher than total aluminum concentrations in all other water samples collected from impact sites (95% UCLM = 0.132 mg/L) but is not considered an outlier as a duplicate sample had a similarly high aluminum concentration and RPD results did not indicate sample contamination.

To answer the question of whether water quality had changed during the monitoring period compared to baseline water quality, the mean COPC concentration across impact sites from the monitoring period was compared to the Baseline WQ NPM. The Baseline WQ NPM was derived from baseline surface water quality collected between 2016 and September 2022, as described in the HHTAM report (ERM 2023f).

The mean concentration of iron (0.238 mg/L) was higher than the Baseline WQ NPM (0.22 mg/L; Table 4.5-3). The exceedance factor between the monitoring period mean concentration and the Baseline WQ NPM for iron was small (1.08 times higher than Baseline WQ NPM). Inspection of time series graphs of the monthly mean concentrations for iron (Appendix E.4) suggested that the potential change in concentrations relative to baseline was likely driven by sporadic or single high data points that can likely be considered outliers (e.g., duplicate sample collected at 661-05 in late 2023). The median concentration (Table 4.5-3), which is a non-parametric statistic that is not as affected by outliers as parametric statistics such as mean concentration, of iron were below the Baseline WQ NPMs. As there was no discharge from the Mine to surface water during the monitoring period, the elevated concentration of iron is likely naturally occurring. Further, if increases in COPC concentrations were due to Construction activities at the mine site, impact sites closer to the mine site would be expected to experience higher COPC concentrations than downstream impact sites. However, this was not generally observed (Appendix E.4).

As required by the CFMP, to test whether the increase in iron concentration compared to baseline were significant, a BACI analysis was performed (see Section 4.5.6 for Statistical Analysis results).

Mean concentrations of total molybdenum, which had exceeded the Baseline WQ NPM in the period from October to December 2022 (ERM 2023d) , were not observed to be greater than the Baseline WQ NPM during the current monitoring period. The previous exceedance was likely an artifact of the shorter monitoring period and missing samples from Tatelkuz Lake from the last quarter of 2022, as the lake generally has lower molybdenum concentrations than streams in this area.

TABLE 4.5-3 SUMMARY STATISTICS OF SURFACE WATER QUALITY MONITORING RESULTS AT IMPACT SITES, 2023

COPC	n > DL	Summary Statistics of COPC Concentrations in Surface Water, Impact Sites [a] (n = 378; mg/L)						Baseline WQ NPM (mg/L)	DWQG NPM [b] (mg/L)

Notes:
COPC = contaminant of potential concern; n = number of samples; DL = detection limit; 95% UCLM = 95% upper confidence limit of the mean; WQ = water quality; NPM = numeric performance objective; ng = no drinking water quality guideline or standard is available.
Data collected between October 1, 2022 and December 31, 2023 were included in the calculation of summary statistics.
Concentrations measured to be less than the DL were replaced with concentrations of 0.5 x DL for the purpose of calculating summary statistics.
"-" means that summary statistics, other than minimum and maximum, have not been calculated as more than 70% of samples were below DL.
The 95% UCLM was calculated using bootstrapping methods, which are free of parametric assumptions.
[a] Sites: CC-05, DC-05, DC-10, DC-15, DC-20, 661-03, 661-04, 661-05, 661-10, 661-20, CC-10, CC-15, CC-20, CC-30, CC-40, TC-05, TC-10, and TC-15.
[b] DWQG NPM = drinking water quality guideline numeric performance objective which is the lowest (most conservative) of the BC Contaminated Sites Regulation (B.C. Reg. 375/96) Schedule 3.2 Drinking Water Standards, the BC Source Drinking Water Guideline (BC ENV 2020b), and the Health Canada Drinking Water Quality Guideline (Health Canada 2022).
Bold italicized font denotes a mean concentration greater than the Baseline WQ NPM.
Bold font and grey shading denotes concentrations greater than the DWQG NPM.

4.5.5 COMPARISON OF COPC CONCENTRATIONS AT SITES INCLUDED IN THE SURFACE WATER QUALITY MODEL TO PREDICTED WQ NPMS

The following sites were included in the SWQ model (Lorax 2022) as assessment nodes and are impact sites for monitoring water quality: DC-05, DC-10, DC-15, DC-20, 661-05, 661-10, 661-20, CC-10, CC-15, CC-20, CC-30, and CC-40. As the SWQ model used different assessment node names than the CFMP program, Table 4.5-4 provides the names of assessment nodes and corresponding CFMP monitoring sites.

TABLE 4.5-4 WATER QUALITY MODEL ASSESSMENT NODES AND CFMP SAMPLING SITES

Watershed	Water Quality Model Assessment Node (Lorax 2022)	CFMP Monitoring Site Name
Davidson Creek	WQ28	DC-05
	WQ27	DC-10
	WQ26	DC-15
	WQ7	DC-20
Creek 661	WQ3	661-05
	WQ5	661-10
	WQCk661	661-20
Chedakuz Creek	WQ8	CC-10
	WQ9	CC-15
	WQ13	CC-20
	Chedakuz Midway	CC-30
	Chedakuz Outlet	CC-40

Data collected from these SWQ model node sites during the monitoring period was used to confirm that measured concentrations of COPCs in water were within the range predicted by the SWQ model v.13e (Lorax 2022) and that the predicted surface water concentrations used in the Project Case HHRA (Entia 2022b) represented a conservative exposure scenario. Table 4.5-5 provides summary statistics for water quality during the monitoring period at the impact sites that were included as assessment nodes in the SWQ model and compares the mean to the Predicted WQ NPM. The Predicted WQ NPM was derived from outputs of the SWQ model v.13e (Lorax 2022), as described in the HHTAM report (ERM 2023f).

For all COPCs except iron, the mean concentration was lower than the Predicted WQ NPM. For iron, the mean concentration (0.253 mg/L) was marginally (1.33 times) greater than the Predicted WQ NPM concentration (Table 4.5-5). It is also interesting to note that the Baseline NPM (0.22 mg/L, see Section 4.5.4 in Table 4.5-3) for iron is higher than the Predicted NPM for iron (0.19 mg/L in Table 4.5-5), which suggests that the SWQ model may have underestimated the baseline iron concentrations (since predicted concentrations included baseline plus Project contributions). Regardless, the mean iron concentration in surface water of 0.253 mg/L is well below levels of concern for human health, as mean concentrations of iron were 25 times lower than the DWQG NPM of 6.5 mg/L (Table 4.5-5).

TABLE 4.5-5 SUMMARY STATISTICS OF COPC CONCENTRATIONS IN SURFACE WATER FOR SWQ MODEL NODE SITES, 2023

COPC	n > DL	Summary Statistics of COPC Concentrations in Surface Water for SWQ Model Node Sites[a] (n = 244; mg/L)						Predicted WQ NPM (mg/L)	DWQG NPM [b] (mg/L)
		Minimum	Mean	Median	95% UCLM	95th Percentile	Maximum		
Aluminum	244	0.00790	0.123	0.0359	0.163	0.499	**3.39**	0.15	2.9
Antimony	9	<0.000105	-	-	-	-	0.000200	0.0025	0.006
Arsenic	244	0.000420	0.000792	0.000695	0.000829	0.00130	0.00296	0.0012	0.01

Molybdenum	244	0.000178	0.000775	0.000777	0.000806	0.00103	0.00272	0.0013	0.088
Nickel	23	<0.00050	-	-	-	-	0.00450	0.00056	0.08
Selenium	189	<0.000050	0.0000590	0.0000620	0.0000620	0.0000936	0.000142	0.00018	0.01
Thallium	2	<0.000010	-	-	-	-	0.0000420	0.000037	ng
Zinc	17	<0.0030	-	-	-	-	0.0103	0.0051	3.0

Notes:
COPC = contaminant of potential concern; n = number of samples; DL = detection limit; 95% UCLM = 95% upper confidence limit of the mean; SWQ = Surface Water Quality; WQ = water quality; NPM = numeric performance objective; ng = no drinking water quality guideline or standard is available.
Data collected between October 1, 2022 and December 31, 2023 were included in the calculation of summary statistics.
Concentrations measured to be less than the DL were replaced with concentrations of 0.5 x DL for the purpose of calculating summary statistics.
"-" means that summary statistics, other than minimum and maximum, have not been calculated as more than 70% of samples were below DL.
The 95% UCLM was calculated using bootstrapping methods, which are free of parametric assumptions.
Outliers exceeding threshold based on professional judgement were removed while values exceeding the 99th percentile were flagged but retained in the dataset.
[a] Sites: DC-05, DC-10, DC-15, DC-20, 661-05, 661-10, 661-20, CC-15, CC-20, CC-30, and CC-40.
[b] DWQG NPM = drinking water quality guideline numeric performance objective which is the lowest (most conservative) of the BC Contaminated Sites Regulation (B.C. Reg. 375/96) Schedule 3.2 Drinking Water Standards, the BC Source Drinking Water Guideline (BC ENV 2020b), and the Health Canada Drinking Water Quality Guideline (Health Canada 2022).
Bold italicized font denotes a mean concentration greater than the Predicted WQ NPM.
Bold font and grey highlight denotes concentrations greater than the DWQG NPM.

These comparisons indicate that the concentrations of most COPCs in surface water were within the range predicted by the SWQ model and that concentrations used to represent surface water EPCs in the HHRA were reasonably conservative. While the marginal exceedance of the Predicted WQ NPMs for the mean concentration of iron indicates that water quality in 2023 may have changed in a manner not predicted by the SWQ model, this is not likely to be a Mine effect. The apparent increase in iron concentration relative to predicted concentrations is likely driven by single high concentrations of iron in the 2023 monitoring data (see Section 4.5.4 and Appendix E.4) and a marginal underprediction of iron concentrations in the SWQ model, as there were no discharges to surface water from the Mine in 2023.

As required by the CFMP, to test whether the increase in iron concentration compared to Predicted WQ NPMs was significant, a BACI analysis was performed (see Section 4.5.6 for Statistical Analysis results).

4.5.6 STATISTICAL ANALYSIS

4.5.6.1 METHODOLOGY

To further assess potential Mine-related effects on concentrations of selected COPCs in surface water, a BACI analysis was completed. Analysis was performed using R statistical computing package (R Development Core Team 2022). Details of methodology and the results are provided in Appendix C.3.

As required under the CFMP, BACI analysis was carried out for total iron in surface water as mean iron concentrations were higher than the Baseline and Predicted NPMs. Highly censored parameters (i.e., greater than 70% of data were below the DL) were considered unreliable and were not subjected to BACI analysis; iron was detectable in 96% of all samples (see Appendix E.3), so censoring was not an issue. The percent detection for all parameters across the entire study area during baseline and monitoring is illustrated on Figure 1 in Appendix E.3.

A subsequent query for censored data was carried out for iron for each site included in the BACI analysis (Appendix C.3). Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. A table with the number of observations removed from each site per year is provided in Appendix C.3.

Duplicates were averaged and field and travel blanks were removed prior to analysis. Data transformations (e.g., log transformation) were completed if determined to be appropriate (e.g., to achieve random distribution of residuals). Outliers were identified but not removed prior to BACI.

The standard approach to BACI used log-10 transformed data to assess potential impacts to water quality, where the mean of baseline data collected prior to the start of Early Works Construction ("before"; up to the end of September 2022) is compared to the mean of monitoring data after the start of Early Works Construction ("after"; October 2022 onward) at both control and impact sites. Water quality data were grouped into control sites and potential impact sites (as per Section 3.4). The main statistic of interest in a BACI analysis is an ANOVA interaction term (Before-After × Control-Impact, or BA × CI), which would be significant when a change occurs at the impact site but not at the control site (Smokorowski and Randall 2016).

4.5.6.2 RESULTS

Box plots illustrating parameter concentrations in baseline and during monitoring at control and impact sites are located in Appendix E.3.

Appendix C.3 shows the results of the BACI linear model for total iron. The threshold for significance was assumed to be $p = 0.001$. The results indicate that the change in total iron concentration at potential impact sites from before start of Early Works Construction to after the start was not significant (*adjusted* $p = 0.49$) from the change at control sites.

4.6 FISH TISSUE MONITORING RESULTS

4.6.1 COMPARISON OF COPC CONCENTRATIONS IN FISH TISSUES BETWEEN 2023 AND 2021/2022 DATA

In 2021 and 2022, some of the dissected fish tissues and whole fish samples processed by Biologica Environmental Services were shipped to the analytical laboratory (ALS Laboratories, Burnaby, BC) wrapped in aluminum foil, which could have leached and inadvertently resulted in elevated tissue metal concentrations, especially aluminum. These data were used to form the baseline dataset for fish tissue metal concentrations and, therefore, any issues due to potential sample contamination would have affected the Baseline Fish Tissue NPMs.

Aluminum is the primary metal of concern for contamination of tissue metal samples wrapped in aluminum foil as, depending on the manufacturer, it makes up to 99% of the content of aluminum foil, although traces of other metals (e.g., iron, silicon, manganese, and zinc, with concentrations up to 0.1%) may also be present (for instance, see https://www.steeltd.com/product/8011-aluminum-foil.html). To address this uncertainty and determine whether aluminum, or other metal, concentrations were altered by the use of aluminum foil, a statistical comparison using muscle tissue COPC concentration from different years (2021, 2022, and 2023) was performed. The analysis focused on control sites only to exclude potential confounding effects of changes, if any, due to the Mine at impact sites in 2023. The hypotheses for consideration were:

Null Hypothesis, H_0:

> Aluminum concentrations in fish tissue collected in 2021 and 2022 were not affected by wrapping in aluminum foil prior to laboratory submission.

Alternate Hypothesis, H_A:

> Aluminum concentrations in fish tissue collected in 2021 and 2022 were altered by wrapping in aluminum foil prior to laboratory submission. If this alternate hypothesis is true, there should be a difference between 2021 and 2022 data versus 2023 data, but 2021 and 2022 data should be similar. Tissue concentrations of aluminum should also be higher in 2021 and 2022 than in 2023.

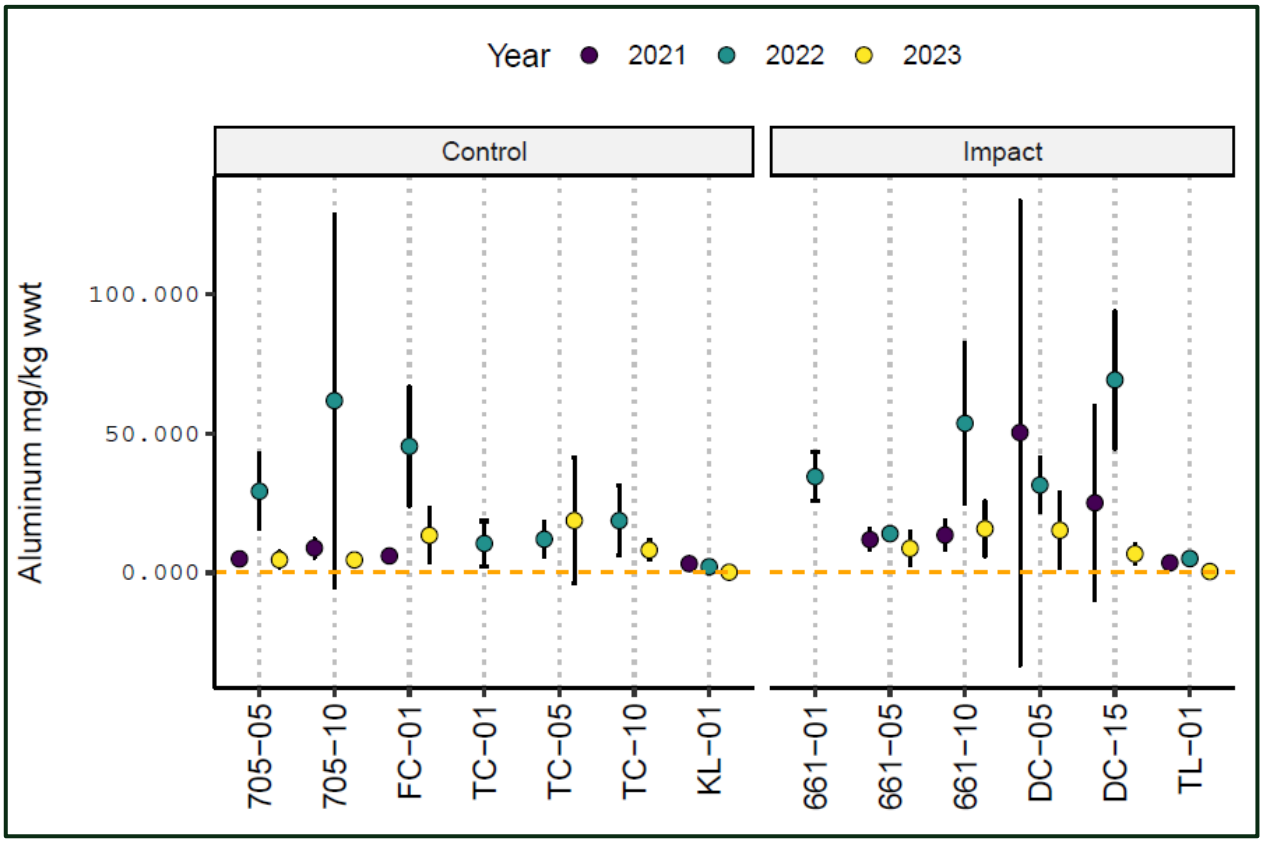
To reduce the number of comparisons, analytes had to have at least a 30% detection rate (no more than 70% non-detects) over three years (2021-2023) to be included in further investigation. This included aluminum, arsenic, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, molybdenum, selenium, thallium, and zinc. Fish tissue data from 2023 were compared to fish tissue data from 2021 and 2022 using a mixed-effects linear regression with site ID as a random effect. Significant differences were followed up with post-hoc tests to determine

which years were different. Significance was determined as false-discovery-rate (FDR) controlled p-value < 0.05 (Benjamini and Hochberg 1995). Most COPCs followed an approximately log-normal distribution in values, therefore a log10 transformation was applied prior to analysis.

The mixed-effects linear regression analysis showed that aluminum (and all analyzed COPCs except arsenic and mercury) had a significant difference among years at the control sites in the overall tests after *p*-value correction ($p < 0.05$). The significant differences in concentration among years were followed up with post-hoc tests to determine which years were different for aluminum in fish tissue.

Fish tissue metal concentrations of aluminum are shown on Figure 4.6-1, by site, with dots and whiskers representing the mean +/- standard deviation. Results of statistical analysis showed that aluminum concentrations in fish tissue were significantly different amongst years (corrected $p < 0.05$) across control sites. The effects ratio across control sites was approximately 2 times higher in 2021 than in 2023, while the effects ratio across control sites was approximately 4 times higher in 2022 than in 2023. However, aluminum was also significantly different ($p = 0.008$) between 2021 and 2022, the two years in which fish tissues were wrapped in aluminum foil.

FIGURE 4.6-1 ALUMINUM CONCENTRATIONS IN FISH TISSUE, 2021-2023



Visual examination of the fish tissue metal data for aluminum in Figure 4.6-1 on a site-by-site basis also does not identify consistent inter-annual trends, as sometimes aluminum is higher in 2021 and 2022 versus 2023 (e.g., 705-10), higher in 2023 (e.g., TC-05), or 2023 concentrations are between 2021 and 2022 concentrations (e.g., FC-01). Mean fish tissue aluminum concentrations do generally appear to be highest in 2022 at most sites where more than one year

of data are available, and mean concentrations generally appear similar between 2021 and 2023 at sites that were sampled in both years.

Although it is possible that inherent variability (i.e., within year variability between fish sampled at a given site) in fish tissue concentrations is obscuring potential effects of aluminum foil, the statistical analysis and visual examination of the data support the conclusion that wrapping, storing, and shipping fish tissues in aluminum foil did not lead to consistent or detectable differences in aluminum tissue concentrations collected at control sites between 2021 and 2022 or 2023. Rather, observed differences are likely due to inter-annual variability in tissue metal composition, and the null hypothesis (H_0) is the more likely conclusion (aluminum foil wrapping did not affect fish tissue concentrations of aluminum in a systematic way).

4.6.2 COMPARISON OF COPC CONCENTRATIONS TO CF GUIDELINE NPMS

Raw 2023 fish tissue quality data are located in Appendix A.4. Graphical representation of the 2023 data in comparison to 2021 and 2022 fish tissue data are provided in Appendix E.5.

Table 4.6-1 provides summary statistics for COPC concentrations in fish samples from across the CFMP study area, including juvenile RB from Creek 661 (661-04 and 661-05, n = 11; 661-10, n = 8), Davidson Creek (DC-05, n = 8; DC-15, n = 8), Creek 705 (705-05, n = 8; 705-10, n = 8), Turtle Creek (TC-05, n = 8; TC-10, n = 8), and Fawnie Creek (FC-01, n = 8), and adult RB, MW, and KO from Tatelkuz Lake (TL-01, n = 8 for each species) and RB and MW from Kyakuz Lake (KL-01, n = 7 for RB and n = 10 for MW). Results are discussed in detail in the *AEMP Interpretive Report* (ERM 2024).

Table 4.6-1 includes a comparison of the study area-wide mean fish tissue concentration to the CF Guideline NPMs for fish. As shown in Table 4.6-1, mean concentrations of all COPCs in fish whole body and muscle were below the CF Guideline NPMs for fish.

4.6.3 COMPARISON TO BASELINE FISH TISSUE NPMS

The Baseline CF NPM for fish tissues was calculated based on 2021 and 2022 fish tissue concentrations from RB, MW, and KO at impact sites at Davidson Creek (DC-05, DC-15), Creek 661 (661-05, 661-10), and Tatelkuz Lake (TL-01) as described in the HHTAM report (ERM 2023f). Therefore, only 2023 fish tissue data from the same sites (n = 59) were used to calculate and compare the mean concentration to the Baseline Fish Tissue NPM.

The comparison showed that mean concentrations of COPCs in 2023 did not exceed the Baseline Fish Tissue NPM (Table 4.6-2).

4.6.4 COMPARISON TO PREDICTED FISH TISSUE NPMS

The Predicted Fish Tissue NPMs were calculated based on 2021 and 2022 fish tissue concentrations from RB, MW, and KO at Impact sites at Davidson Creek (DC-05, DC-15), Creek 661 (661-05, 661-10), and Tatelkuz Lake (TL-01), multiplied by the incremental change in fish tissue concentration between Baseline Case and Project Case from the *2022 HHRA Update* report, as described in the HHTAM (ERM 2023f). Only 2023 fish tissue data from the same sites (n = 59) were used to calculate summary statistics and compare the mean to the Predicted Fish Tissue NPM (Table 4.6-2). None of the mean concentrations of the COPCs exceeded the Predicted Fish Tissue NPMs.

TABLE 4.6-1 STUDY AREA-WIDE SUMMARY STATISTICS FOR COPC CONCENTRATIONS IN FISH TISSUE AND COMPARISON TO CF GUIDELINE NPMS FOR FISH TISSUE, 2023

COPC	n > DL	Summary Statistics of COPC Concentrations in Fish Tissues, Study Area-Wide (n = 116; mg/kg ww)								CF Guideline NPM for Fish (mg/kg ww)

Notes:
COPC = contaminant of potential concern; n = number of samples; DL = detection limit; UCLM = upper confidence limit of the mean; CF = country foods; NPM = Numeric Performance Metric; ww =wet weight.
Concentrations measured to be less than the DL were replaced with concentrations of 0.5 x DL for the purpose of calculating summary statistics.
"-" means that summary statistics, other than minimum and maximum, have not been calculated as more than 70% of samples were < DL.
Bold font and grey shading denote concentrations greater than the CF Guideline NPM for fish tissue.

TABLE 4.6-2 IMPACT SITES SUMMARY STATISTICS FOR COPCS CONCENTRATIONS IN FISH TISSUE AND COMPARISON TO BASELINE AND PREDICTED NPMS FOR FISH TISSUE, 2023

"-" means that summary statistics, other than minimum and maximum, have not been calculated as more than 70% of samples were < DL.
[a] Impact sites are in Davidson Creek (DC-05, DC-15), Creek 661 (661-05, 661-10), and Tatelkuz Lake (TL-01).

4.6.5 STATISTICAL ANALYSIS

Table 4.6-2 and 4.6-3 present the summary statistics for fish tissue samples collected in 2023 for impact and control sites, respectively.

As per the CFMP, a BACI analysis is only required when an increase in fish tissue COPC concentrations above baseline and predicted concentrations is detected. A BACI analysis was not performed because the mean 2023 fish tissue COPC concentrations were below the CF Guideline NPM for Fish, the Fish Tissue Baseline NPM, and the Predicted Fish Tissue NPM (Sections 4.6.1, 4.6.2, and 4.6.3).

However, data were interrogated for any potential trends between subareas. This analysis was completed with the intent to incorporate 2023 sampling results for fish into the 2021-2022 baseline dataset. A comparison of concentrations from impact and control site fish tissues showed that there were no significant differences for any of the COPCs in fish tissues in 2023 between these subareas (Table 4.6-4). Because the observed differences in COPC concentrations between years are likely due to inter-annual variability in tissue metal composition (Section 4.6.1 and Appendix E.5), the 2023 data are not above the Baseline Fish Tissue NPMs (Section 4.6.3), and the Mine did not discharge to surface water in 2023, fish tissue data from 2023 will be incorporated into the 2021-2022 datasets. Further discussion is provided in the 2023 AEMP Interpretive Report (ERM 2024).

4.7 SMALL MAMMAL TISSUE RESULTS

4.7.1 SUMMARY STATISTICS

As 2023 was the first year of small mammal (rodent) tissue sampling, tissue quality data reported in this section are considered baseline data to be used for future monitoring. Because there are no triggers in the adaptive management plan of the CFMP for human health based on rodent tissues, comparisons to NPMs are not performed. It is anticipated that Early Works construction activities had limited effect on tissue quality; however, data from near-field (impact) and control subareas were compared to investigate whether there are differences between these areas due to natural conditions identifiable across COPCs and species.

Twenty three (23) animals were trapped at near-field sites (CFMP-SV-004, -006, -014, -019), and 34 animals were trapped at control sites (CFMP-SV-024, -027, -032, -040) in September 2023. The number of animals for each species at each site are listed in Table 4.7-1.

Raw tissue metal data are presented in Appendix A.5. Summary statistics of concentrations of COPCs in liver and in carcass (rest of body, minus liver) for both species of rodents combined across the study area and in near-field and control subareas are presented in Tables 4.7-2 to 4.7-7.

TABLE 4.6-3 CONTROL SITES SUMMARY STATISTICS FOR COPC CONCENTRATIONS IN FISH TISSUE, 2023

COPC	n > DL	Summary Statistics of Parameter Concentrations in Fish Tissues, Control Sites a (n = 57; mg/kg ww)							
		Minimum	Mean	Standard Deviation	Standard Error	95% UCLM	Median	95th Percentile	Maximum

4.7.2 STATISTICAL ANALYSIS

Appendix E.6 presents box plots of COPCs with detection levels greater than 30% (i.e., fewer than 70% non-detects) in either liver or carcass of small mammals. Concentrations of COPCs were plotted separately for carcass and liver tissues as there were differences in concentrations between these tissues.

Linear models were used to compare concentrations in carcass and liver tissues separately between control and near-field subareas, controlling for species differences. Thus, the models included both a "between species" term and a "control/impact" term to assess if there is a significant difference between subareas once species differences were accounted for. All analytes were natural log transformed prior to analysis. The *p*-values for the control/impact terms were adjusted using the Benjamini-Hochberg fdr method (Benjamini and Hochberg 1995). If these adjusted *p*-values were less than 0.05 it was concluded that there was a significant difference between near-field and control subareas. Tables of the comparisons are presented in Appendix C.5.

The adjusted *p*-value for control vs. impact (controlling for species differences) was less than 0.05 for arsenic, cadmium, iron, lead, mercury, and thallium in carcass; and arsenic and iron in liver. These results suggest that there are differences between impact and control for these analytes in carcass and liver respectively. To further understand these differences, the direction and magnitude of the effect was calculated using the ratio of the means of impact and control sites, which is a measure of the difference between the groups. Table 4.7-8 presents the results of this analysis.

TABLE 4.7-8 RATIOS AND MEAN CONCENTRATIONS IN NEAR-FIELD VERSUS CONTROL SUBAREAS, 2023

COPC	Ratio of Model Means	Lower 95% Confidence Interval of Ratio	Upper 95% Confidence Interval of Ratio	Control Subarea		Near-field Subarea	
				Mean	Standard Error	Mean	Standard Error
Carcass							
Arsenic	1.933	1.238	3.018	0.021	0.003	0.042	0.007
Cadmium	2.043	1.357	3.076	0.024	0.003	0.049	0.008
Iron	1.155	1.041	1.281	84.2	2.72	97.3	3.95
Lead	1.550	1.128	2.131	0.041	0.004	0.063	0.008
Mercury	1.545	1.143	2.088	0.026	0.002	0.040	0.005
Thallium	1.910	1.271	2.869	0.002	0.000	0.005	0.001
Liver							
Arsenic	1.915	1.134	3.232	0.009	0.002	0.018	0.004
Iron	0.809	0.681	0.962	172	9.32	139	9.47

The mean ratios suggest that the concentrations of arsenic, cadmium, and thallium in rodent carcasses were approximately two times higher at near-field sites compared to control sites. Lead and mercury concentrations in carcasses were approximately 55% higher and iron concentrations in carcasses were approximately 16% higher at near-field compared to control sites, but 20% lower at near-field compared to control sites for liver. Finally, arsenic in liver was approximately two times higher at near-field compared to control sites.

Small mammals may take up COPCs from ingesting water, soil, and food (other exposure pathways may also be possible but are considered negligible relative to the uptake from these three primary pathways). Both species of rodents that were sampled are omnivores that may eat plants, berries, seeds, insects, and fungi.

Higher concentrations of these COPCs in tissues of small mammals collected at near-field sites may be due to natural variation (e.g., reflecting the proximity of near-field sites to the mineralized mine site or localized areas of higher COPC concentrations), impacts from local wildfires, or impacts from Mine dust. However, there were no statistically significant differences in concentrations of arsenic, cadmium, iron, lead, mercury, or thallium observed in soil or willow tissues between control and near-field subareas in 2023 (see Section 4.35 for soil and Section 4.4.5 for plants), or between soil and plant tissues specifically from the eight mammal sampling sites (data not shown), indicating that the differences observed in small mammal tissues are not due to Mine-related effects.

Except for a few COPCs in tissues (e.g., aluminum in carcass, manganese in liver, nickel in carcass, thallium in liver) it appears that trends in COPC concentration between species were consistent between sub-areas. For example, if a COPC had higher concentration in livers of DM relative to RBV at near-field sites it was also higher in livers in DM relative to RBV at control sites (box plots in Appendix E.6; e.g., arsenic, cadmium, copper, molybdenum). Of note is the apparent difference (not statistically tested) in concentration of mercury in both carcass and livers between the species, where concentrations are higher in RBVs than in DMs. This may indicate species-specific differences in metal concentrations in tissues.

4.7.3 POWER ANALYSIS

A power analysis based on the 2023 small mammal tissue results was conducted in response to comments on the Framework for Small Mammal (Rodent) Sampling under the CFMP by UFN/LDN and their consultants (February 2022). Methods and results of the power analysis are presented in Appendix F. Assuming a sample size of 8 animals per species per site (i.e., 16 per site, for a total of 64 animals at near-field sites and 64 animals at control sites) all analytes with detection levels greater than 70%, combined with tissue type, achieved >80% power to detect a 50% site effect (e.g., near-field sites have on average 50% higher concentrations than control sites). With only four animals per species per site, the power ranged from 60-70% depending on the analyte and tissue combination. A detection of 25% difference in concentration between near-field and control sites could only be achieved at a power of approximately 70% and analyzing 20 animals per species per site.

4.8 QUALITY ASSURANCE / QUALITY CONTROL

4.8.1 SAMPLE INTEGRITY, STORAGE, AND TRANSPORT

4.8.1.1 GENERAL

During field sampling, standard sampling procedures were followed to preserve sample integrity and minimize the chances of cross-contamination. The field trips were completed safely with no environmental or safety incidents, and there were no additional concerns that would suggest the integrity of the samples would have been affected.

After delivery of the samples to the CALA-certified laboratory (ALS Laboratories, Burnaby, BC), a review of the sample receipt confirmation was completed to identify any issues that may have occurred during transport to the lab. The sample receipt confirmation indicated that the samples had been successfully delivered with no issues pertaining to sample and container integrity and all samples were analyzed within recommended holding times.

4.8.1.2 SURFACE WATER

Sampling and laboratory methods were completed in accordance with the AEMP, Version 1.0. Surface water quality sampling included the collection or carrying of 19 field blanks and 19 travel blanks in 2023. With the exception of pH, concentrations of water quality parameters are expected to be less than the detection limit in the blank samples. Measured parameters greater than the detection limit in field blanks represent potential sample contamination during sample preservation or contamination during field blank preparation. Measured parameters greater than the detection limit in travel blanks potentially represent contamination of samples in transit, contamination during laboratory analysis, or contamination during travel blank preparation.

There were 55 detectable values overall, most of which were detected in one travel blank (VA23C5293-008, n = 27, October 2023) and one field blank (VA23B7293-002, n = 4, July 2023). This travel blank laboratory batch (VA23C5293) was investigated further, and all samples within this batch (TL-01, TL-02, TL-03, and TL-04) appeared to be uninfluenced as parameter concentrations were generally within their historical ranges. (Note that sites TL-02 to TL-04 are sites included under the AEMP, but not the CFMP). All other blanks had limited detectable values (n = 1 to 2). Acidity was detected frequently (57.9% of the field blanks and 52.6% of the travel blanks), whereas other parameters were detected infrequently (< 6%). Overall, the results suggest that field and travel blanks collected during the monitoring period indicate that field sampling procedures were successful at avoiding sample contamination. Travel and field blank results are provided in Appendix A.3.

While the laboratory noted a few instances of method blank values, internal duplicate, matrix spikes, control sample recovery, and parameter frequency laboratory targets not being met, these checks overall met ALS Laboratories data quality objectives for internal QA/QC, and the report was issued and distributed by ALS Laboratories without further comment.

4.8.2 DUPLICATES AND RELATIVE PERCENT DIFFERENCE (RPD)

4.8.2.1 GENERAL

Field-split duplicate samples were submitted to ALS laboratory for blind analysis for approximately 10% of samples (4 replicates for soil, and 44 replicates for surface water). For vegetation (plants and berries), field-split duplicates represented about 5% of total samples.

The RPD values were calculated to evaluate variability among duplicate samples. Calculation of the RPD was performed for all parameters with measured values greater than five times the MDL. The results of RPD calculations for soil and for plant tissues are provided in Appendix G.1 and G.2. RPDs for surface water samples are presented as part of the 2023 AEMP Interpretive Report (ERM 2024) and reproduced in Appendix G.3.

4.8.2.2 SOIL

A total of 144 RPD calculations were performed for soil, of which 83 had concentrations greater than five times the DL. Based on CCME (2016), due to the high matrix variability in soils, an acceptable RPD value for duplicate soil samples is not exceeding 60%. Of the total calculations, less than one percent (n = 1; manganese) was at 60% and none were higher than 60%. This result indicates that for all soil parameters with values greater than five times the DL, sample replication was overall successful, samples were reasonably homogenous, and were within the typical margin of natural variability. There were no systematic issues with soil sampling or analytical methods.

4.8.2.3 PLANTS

Calculations for RPDs in plant tissues were based on the primary laboratory result in mg/kg dry weight to limit variability introduced by conversion to wet weight using moisture content. A total of 148 RPD calculations were performed for plants, of which 70 were based on concentrations greater than five times the DL. Based on CCME (2016), and assuming that plant tissues have similar matrix variability as soils, an acceptable value for duplicate plant tissue samples is not exceeding 60%. Of the total calculations, less than one percent (n = 1; arsenic) was higher than 60%. This indicates that sample replication was overall successful, samples were reasonably homogenous, and were within the typical margin of natural variability. There were no systematic issues with plant tissue sampling or analytical methods.

4.8.2.4 SURFACE WATER

Forty-four (44) field duplicates were collected in 2023 (Appendix F.3), of which 36 were collected from streams under the CFMP. A total of 3,312 relative percent difference (RPD) comparisons were made in 2023 for these stream sites, and 1,244 RPDs were calculated. The BC provincial government recommends that any field duplicates with RPD values exceeding 20% indicate a possible problem and RPD values above 50% suggest a definite problem, most likely either contamination or lack of sample representativeness (BC ENV 2013).

Of the calculated RPDs, 2.6% (n = 33) of the RPDs were in the range of 20% to 50%, and 0.8% (n = 10) of the RPDs were greater than 50%. This result indicates for the majority of parameters with values greater than five times the DL in Mine streams, sample replication was overall successful, did not indicate any systematic issues with sampling or analytical methods, and was within the typical margin of natural variability. The RPD calculations greater than 20% were limited to 25 parameters: turbidity, sulfate, total Kjeldahl nitrogen, total phosphate; dissolved organic carbon; total and dissolved aluminum, barium, calcium, magnesium, molybdenum, silicon, and uranium; and total iron, manganese strontium, and titanium.

5. ADAPTIVE MANAGEMENT AND ACTION LEVELS

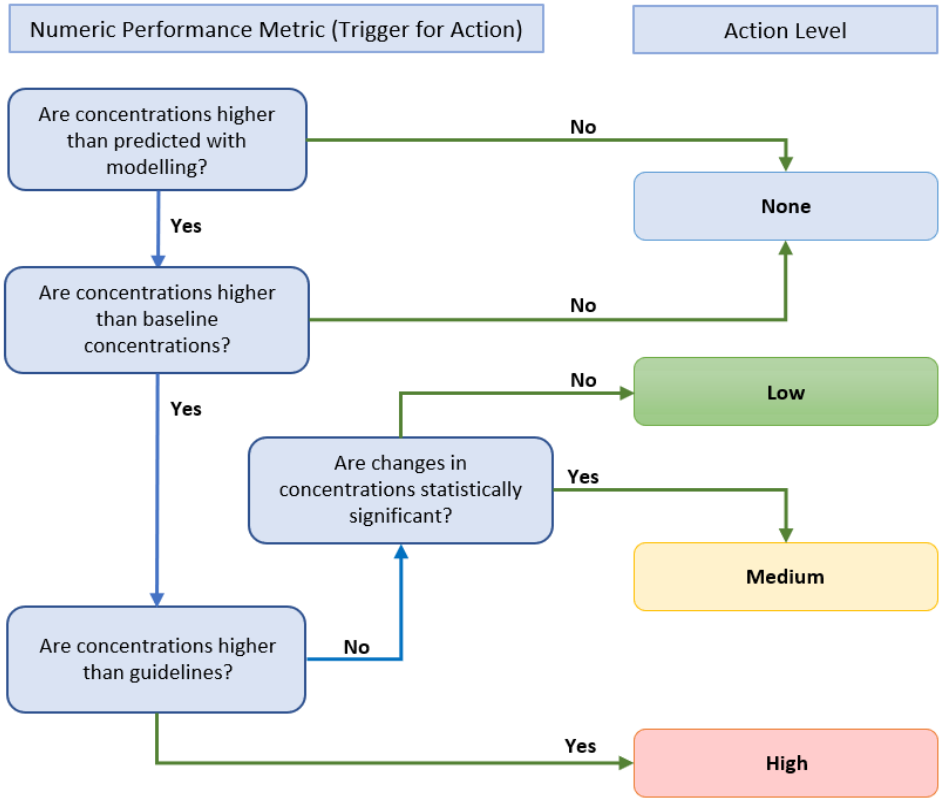
An adaptive management framework is provided in Section 6 of the CFMP and was briefly described in Section 2.

The following subsections describe the country foods trigger response framework (Section 5.1) and identify the action level under the CFMP adaptive management framework based on the monitoring data collected in 2023 (Sections 5.2 to 5.6).

5.1 COUNTRY FOODS TRIGGER RESPONSE FRAMEWORK

Triggers (or NPMs) are provided at the following action levels of the adaptive management framework: none, low, medium, and high. The framework is intended to provide an early-warning system such that there is sufficient time to prevent adverse effects to human health when defined action levels are triggered. An overview of the trigger response framework and action levels is provided in Figure 5.1-1. Note that Figure 5.1-1 has been modified slightly from the one shown in the CFMP Version 1.0 so that statistical significance is secondary to whether concentrations are higher than guidelines (i.e., a high action level is triggered if there are exceedances of guidelines, baseline, and predicted concentrations, regardless of whether changes are identified to be statistically significant or not).

FIGURE 5.1-1 OVERVIEW OF ACTION LEVELS AND TRIGGERS (NUMERIC PERFORMANCE METRICS)



Additional details about the trigger response framework can be found in Section 6 of the CFMP. The human health trigger concentrations or NPMs used in the trigger response framework based on predicted COPC concentrations, baseline COPC concentrations, and guidelines or standards are briefly described in Section 4.1 and their derivation is further described in the HHTAM (ERM 2023f).

5.2 ACTION LEVEL BASED ON AIR QUALITY MONITORING IN 2023

Based on comparisons of calculated PM_{10}-associated COPC concentrations during the 2023 monitoring period, of the four measurable COPCs associated with PM_{10} (aluminum, iron, lead, and manganese), lead and manganese concentrations in PM_{10} were higher than the Baseline AQ NPM and the Predicted AQ NPM, but less than the AQ Guideline NPM (Table 5.2-1 and Section 4.2).

TABLE 5.2-1 TRIGGER AND MANAGEMENT RESPONSE BASED ON PM10-ASSOCIATED METALS IN AIR

Level	Trigger	Management Response
Low	Mean annual metal concentrations in air (associated with PM_{10}) may be increasing in a manner not predicted by the air quality model but are below levels of concern. Measured mean annual metal concentrations in PM_{10} are: • Higher than the predicted EPC plus 20%; and • Higher than the baseline trigger concentration plus 20%; and • Less than the OAAQCs or ESLs; • but changes in concentration are not statistically significant between near-field and control sites or compared to baseline conditions (BACI analysis).	• Identify causes of potential changes in concentrations so that existing mitigation measures can be adjusted or targeted mitigation measures can be identified for implementation if needed. • Plan a dust sampling program to define the magnitude, spatial extent, and reversibility of the potential effect. • After two cycles of monitoring with no statistically significant effects, decrease sampling frequency to once every six years • Other responses as defined in the AQDMP report.

BACI analysis found that the concentrations of lead in PM_{10} were not significantly different (p = 0.56). While, concentrations of manganese in PM_{10} were significantly different (p = 0.015), it was the control site that had the higher concentrations in 2023, which is not likely attributed to Mine effects.

As per Table 6.3-1 of the CFMP (ERM 2022), the current level in the trigger response plan for air quality is the “Low” action level for 2023. However, no specific immediate action is recommended based on 2023 monitoring results because:

- Concentrations higher than Baseline AQ NPMs were predicted to occur, so exceedance of the Baseline NPM is not of concern on its own. Quantities of most COPCs in dustfall (and concentrations in PM_{10}) at both control and impact sites were below DLs.
- Concentrations higher than the Predicted NPMs are likely an artefact of the methods used to estimate metal concentrations in PM_{10} (proportions of metals based on baseline soil concentrations) in the *HHRA Update report* (Entia 2021, 2022a). The measured PM10 from 2023 was 11.2 µg/m^3, while the PM10 concentration used to represent Project Case (baseline +

Project) concentrations in the *HHRA Update* report (Entia 2021, 2022a) was 11 µg/m^3. The PM_{10} concentrations are very similar, so it is likely that the proportions of metals derived from baseline soil concentrations is not fully representative of the metal proportions in dustfall. During the next update of the HHRA or the HHTAM report, it is recommended that more representative concentrations for metals in dust (PM_{10}) be used, rather than using soil concentrations.

- The only statistically significant change identified in 2023 in the BACI analysis was for manganese in PM_{10} where the concentrations were higher at control sites, not impact sites. While the change is statistically significant, it is not a Mine effect.

5.3 ACTION LEVEL BASED ON SOIL QUALITY MONITORING IN 2023

As described in Sections 4.3.1 to 4.3.4, the mean 2023 soil metal concentrations across the CFMP study area did not exceed the SQ Guideline NPM, SQ Baseline NPM, or the Predicted SQ NPM and, therefore, the resulting trigger level is “None” (Table 5.3-1).

TABLE 5.3-1 TRIGGER AND MANAGEMENT RESPONSE BASED ON METAL CONCENTRATIONS IN SOIL

Level	Trigger	Management Response
None	Mean measured metal concentrations in soil are: • Less than or equal to the predicted concentration plus 60%; or • Less than or equal to the baseline trigger concentration plus 60%; or • Less than the soil quality guidelines.	• No change to mitigation as mitigation measures are performing as expected • After two cycles of monitoring with no statistically significant effects, decrease sampling frequency once every six years

5.4 ACTION LEVEL BASED ON PLANT AND BERRY QUALITY MONITORING IN 2023

As described in Sections 4.4.1 to 4.4.4, the mean 2023 plant metal concentrations across the CFMP study area did not exceed the CF Guideline NPM, the Baseline CF NPM for Plants, or the Predicted Plant NPM. Although arsenic concentrations in one of the two berry samples collected in 2023 exceeded the CF Guideline NPM, the Baseline Berry NPM, and the Predicted Berry NPM, based on previous berry arsenic results it is likely that this concentration is an outlier (see Section 4.4.4). Therefore, the resulting trigger level for plants and berries is “None” (Table 5.4-1).

TABLE 5.4-1 TRIGGER AND MANAGEMENT RESPONSE BASED ON METAL CONCENTRATIONS IN PLANTS AND BERRIES

Level	Trigger	Management Response
None	Mean measured concentration in plants or berries are: • Less than or equal to predicted concentrations in plants or berries plus 60%; and • Less than or equal to baseline trigger concentration in plants or berries plus 60%; or • Less than country foods trigger benchmarks.	• No change to mitigation as mitigation measures are performing as expected • After two cycles of monitoring with no statistically significant effects, decrease sampling frequency to once every six years

5.5 ACTION LEVEL BASED ON SURFACE WATER QUALITY MONITORING IN 2023

Mean COPC concentrations measured in surface water during the period from October 1, 2022 to December 31, 2023 were compared to NPMs. The data from October to December 2022 were included in this comparison for the 2023 monitoring period as this was a period of only three months and did not constitute a full year.

Mean concentrations of all COPCs at impact and control sites were below the DWQG NPMs; therefore, concentrations are below levels of concern for human health (Section 4.5.1). With the exception of iron, mean concentrations of COPCs in surface water at impact sites were lower than the Baseline WQ NPM (Section 4.5.3). Further, with the exception of iron, mean concentrations of COPCs in surface water at prediction sites were lower than the Predicted WQ NPM (Section 4.5.4). BACI for iron showed that the change in concentration above Baseline WQ NPM (with an exceedance factor of 1.08) and the Predicted WQ NPM (exceedance factor of 1.33) was not significant (*adjusted p* = 0.49). Given that there were no discharges to surface water from the Mine in 2024 and the apparent changes in iron concentrations were not significant in 2023, it is likely that concentrations of iron are attributable to naturally occurring conditions and variability, rather than Mine effects on water quality.

As per Table 6.3-4 of the CFMP (ERM 2022), other than the “None” trigger level, the determination of trigger level and recommendations for management responses for surface water quality is based on changes being observed in two or more consecutive years of monitoring. Therefore, the 2024 CFMP Annual Report will undertake the same analysis for surface water quality data as was provided in this report for 2023 and, based on the results for these two consecutive years, make a determination regarding applicable trigger level and management responses for surface water.

5.6 ACTION LEVEL BASED ON FISH TISSUE QUALITY MONITORING IN 2023

As described in Sections 4.6.1 to 4.6.4, the mean 2023 fish tissue COPC concentrations were lower than the CF Guideline NPM, the CF Baseline NPM, and the Predicted CF NPM for fish tissues. Therefore, the resulting Trigger Level is “None” (Table 5.6-1).

In addition, a statistical comparison between means of near-field (impact) and control site COPC concentrations showed that there is no significant difference and, therefore, effects from the Mine on fish tissue COPC concentrations are not likely.

TABLE 5.6-1 TRIGGER AND MANAGEMENT RESPONSE BASED ON METAL CONCENTRATIONS IN FISH

Level	Trigger	Management Response
None	Measured mean concentration in fish are: • Less than or equal to predicted concentrations in fish tissues plus 60%; or • Less than or equal to baseline trigger concentration in fish tissues plus 60%; and • Less than country foods trigger benchmarks.	• No change to mitigation as mitigation measures are performing as expected • After two cycles of monitoring with no statistically significant effects, decrease sampling frequency to once every six years

6. PLANNED CFMP SAMPLING PROGRAM FOR 2024

No sampling of environmental media under the CFMP is planned for 2024, except for regular sampling that occurs under linked monitoring plans (AQDMP and AEMP). This sampling includes sampling of PM_{10} (and other CACs) under the AQDMP, the ongoing monthly and 5-in-30 sampling program for surface water (creeks and lakes) under the AEMP, and fish tissue sampling under the AEMP.

Although not required under the CFMP, fish tissue COPC concentrations will be monitored in 2024 under the AEMP and, therefore, the 2024 CFMP Annual Report will include an analysis of fish tissue data to determine if there are any Mine-related effects on fish as country foods. The 2024 CFMP Annual report will also analyze 2024 data for surface water quality and PM_{10} as they relate to human health.

The monitoring frequency for dustfall, soil, and country foods (plants and berries) under the CFMP is once every three years. As Early Works Construction began in October 2022, the first Construction phase monitoring was completed in 2023 and, therefore, the next routine sampling for these media is planned to occur again in 2026. Under the CFMP, when the trigger level is “none” (as is the case for soil, plants, and berries) or “low” (as is the case for air quality), after two cycles of monitoring with no statistically significant effects, the sampling frequency can be decreased to once every six years. This will be assessed in 2026.

Small mammals will also not be sampled in 2024. The small mammal program was intended to provide baseline or pre-Operations phase concentrations of COPCs in rodent tissues. At minimum, BW Gold has committed to sampling small mammals at the end of Construction phase/beginning of Operations phase, once midway through Operations phase, and once at the end of the Operations phase, with the potential for additional sampling if triggered by changes in other terrestrial media. It is important that the timing of small mammal sampling be coordinated in future sampling events to coincide with sampling of other environmental media, as interpretation of resultant data is improved when concurrent data are available from multiple media (i.e., soil, plants, water). The Indigenous-led hunted game animal program will continue throughout 2024.

7. SUMMARY

The Mine initiated limited Early Works construction activities at the mine site in October 2022, which continued in 2023. In July 2023, a lightning-caused wildfire (Davidson Creek wildfire) occurred in areas adjacent to the Mine, which affected field sampling programs, particularly in the terrestrial environment. Although access to the mine site resumed in late July, the wildfire impacted the field sampling programs under the CFMP by preventing safe access to some sites (e.g., due to presence of danger trees) or burning of species that would normally be sampled at a given site, and the field programs were generally carried out later in the field season (e.g., late August into September) due to access limitations.

Sampling in 2023 under the CFMP included air quality (metals associated with dustfall, as a surrogate for metals associated with PM_{10}), soil, vegetation (plants and berries), small mammals, surface water quality, and fish tissue.

Results of sampling in 2023 are summarized for metals in PM_{10}, soil, plants, surface water, and fish tissue in the following paragraphs in the context of the adaptive management framework for the CFMP. Sampling of small mammals in 2023 was completed to provide baseline or pre-Operations phase data on tissue concentrations of COPCs, as a foundation for future monitoring.

For metals associated with PM_{10}, mean concentrations of all parameters were lower than the AQ Guideline NPMs. However, manganese and lead were found to be higher than the Baseline and Predicted NPMs. BACI analysis for manganese and lead found that changes in lead concentrations were not significant and that manganese concentrations were significantly higher at control sites than at impact sites. Based on results of 2023 monitoring, the trigger level in the adaptive management framework for air quality is “Low”. However, no specific immediate action is recommended based on 2023 monitoring results because concentrations higher than the Predicted NPMs are likely an artefact of the methods used to estimate metal concentrations in PM_{10} and because statistically significant concentrations were higher at control sites, not impact sites, and are not a Mine effect.

For soil, mean concentrations of all parameters were lower than Baseline, Predicted, and Guideline NPMs for soil. Similarly for plants, mean concentrations of all parameters were lower than Baseline, Predicted, and CF Guideline NPMs for plants. For berries, few samples were obtained in 2023 and, other than arsenic in one berry sample, all COPC concentrations were below the Baseline, Predicted, and CF Guideline NPMs for berries. The arsenic concentrations in one huckleberry sample that was higher than the NPMs appears to be an outlier, as it is substantially higher than any arsenic concentration measured previously and significant changes in arsenic concentrations were not noted in either soil or plants. Thus, based on 2023 monitoring results, the trigger level in the adaptive management framework for soil and plants is “None”.

Because of statistically significant differences in tissue concentrations of COPCs in plant (willow, sedge, and Labrador tea) tissues between cumulative baseline data from 2021-2022 and the 2023 monitoring period, it is not recommended to include the 2023 vegetation and soil data in the cumulative 2021-2022 baseline.

There were no Mine discharges to surface water in 2023. Mean concentrations of all parameters were below WQ Guideline NPMs. Except for iron, mean concentrations of all COPCs were below the Baseline and Predicted NPMs. Based on BACI analysis, the apparent change in iron concentrations was not significant and changes in the mean concentration were likely driven by a few samples with high concentrations and are not indicative of Mine-related changes to water quality. Assignment to a trigger level for water quality in the adaptive management was not completed because it is based on monitoring results from two consecutive years of sampling that indicate an exceedance of the Baseline or Predicted NPMs. Since iron concentrations were below all NPMs in 2022, iron was the only parameter with mean concentrations higher than Baseline and Predicted NPMs in 2023, the change in iron concentration was not significant in 2023, and mean iron concentrations are 25 times lower than the DWQG, it is recommended that no immediate action is required based on results of 2023 monitoring in surface water.

For fish tissue, mean concentrations were lower than Baseline, Predicted, and CF Guideline NPMs for fish tissue. Thus, based on 2023 monitoring results, the trigger level in the adaptive management framework for fish tissue is “None”.

Based on the overall results of the 2023 monitoring programs under the CFMP, no adjustments to current mitigation measures to protect human health are required at this time. The results of the 2023 monitoring program are in line with expectations, given the Early Works and other construction activities in 2023, during which there were no Mine discharges of effluent to surface water.

Sampling under the CFMP or linked monitoring programs is proposed for 2024, including the following:

- Air quality for CACs (PASS, Partisol), as described in the AQDMP;
- Fish tissue sampling, as described in the AEMP; and
- Surface water quality.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
cm²	square centimetres
days	days
mg	milligrams
mg/dm².day	milligrams per square decimetre per day

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA23C3366**	Page	: 1 of 10
Client	: **ERM Consultants Canada Ltd.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Jessica Lowey	Account Manager	: Amber Springer
Address	: 10th Floor, 1100 Melville St. Vancouver BC Canada V6E 4A6	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 0700679-02-001 (Blackwater)	Date Samples Received	: 30-Sep-2023 11:00
PO	: 12970	Issue Date	: 18-Oct-2023 18:00
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: ERM/BW Gold SW (VA22-BWGL100-002/Q56205)		
No. of samples received	: 8		
No. of samples analysed	: 8		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Air**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by “mod”).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Metals by CRC ICPMS (Dustfall, mg)	E447 ALS Environmental - Vancouver	Air	EPA 6020B (mod)	This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). Instrumental analysis is by Collision/Reaction Cell ICPMS.
Total Mercury by CVAAS (Dustfall, mg)	E516 ALS Environmental - Vancouver	Air	EPA 245.7	This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry or atomic absorption spectrophotometry (EPA Method 245.7).
Total Dustfalls by Gravimetry (mg)	E880 ALS Environmental - Vancouver	Air	BC LAB MANUAL - PARTICULATE	A well-mixed sample is evaporated at 104°C to dryness. The residue, Total Dustfall, is measured gravimetrically.
Total Metals by ICPMS (Dustfall, mg/dm2.day)	EC447 ALS Environmental - Vancouver	Air	unit conversion	Convert mg/sample to mg/dm2.day by field information.
Total Mercury by CVAAS (Dustfall, mg/dm2.day)	EC516 ALS Environmental - Vancouver	Air	unit conversion	Convert mg/sample to mg/dm2.day based on field information.
Total Dustfalls by Gravimetry (mg/dm2.day)	EC880.A ALS Environmental - Vancouver	Air	BC LAB MANUAL - PARTICULATE	A well-mixed sample is evaporated at 104°C to dryness. The residue, Total Dustfall, is measured gravimetrically. The result is then calculated based on canister area and sampling time.
Dustfall Canister Area (cm2)	EF001A ALS Environmental - Vancouver	Air	Field data	Measurement of sampling area (cm²) of the opening of the dustfall canister is recorded.
Dustfall Canister Sampling Days	EF001B ALS Environmental - Vancouver	Air	N/A	Field dustfall information recorded on ALS report may affect the validity of results.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Vancouver Metals, Burnaby, British Columbia
Cecilia Zhang	Account Manager Assistant	Vancouver Administration, Burnaby, British Columbia
Cindy Tang	Team Leader - Inorganics	Vancouver Inorganics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Vancouver Metals, Burnaby, British Columbia
Kinny Wu	Lab Analyst	Vancouver Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Air**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Air**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Select Service Level Below - Contact your AM to confirm all E&P TATs (surcharges may apply)

Regular [R] ☑ Standard TAT if received by 3 pm - business days - no surcharges apply

PRIORITY (Business Days): 4 day [P4-20%] | 3 day [P3-25%] | 2 day [P2-50%]

EMERGENCY: 1 Business day [E - 100%] | Same Day, Weekend or Statutory holiday [E2 -200% (Laboratory opening fees may apply)]

Date and Time Required for all E&P TATs: dd-mmm-yy hh:mm

For tests that can not be performed according to the service level selected, you will be contacted.

No. of samples analysed	: 73		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Alex Thornton	Analyst	Metals, Burnaby, British Columbia
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Sask Soils, Saskatoon, Saskatchewan
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Ophelia Chiu	Department Manager - Organics	Organics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Ragini Saini	Lab Assistant	Metals, Burnaby, British Columbia
Salimah Khimani	Lab Assistant	Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia
Tony Nguyen	Analyst	Metals, Burnaby, British Columbia
Xihua Yao	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
%	percent
mg/kg	milligrams per kilogram
mg/kg wwt	milligrams per kilogram wet weight
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

PSAL: Sample 020, 026, 037, 040, 059, 064 : Limited sample was available for PSA (100g minimum is standard). Measurement Uncertainty for PSA results may be higher than usual.

Sample Comments

Sample	Client Id	*Comment*
VA23C2014-005	018-SOIL	Sample(s) XXX: Limited sample was available for PSA (100g minimum is standard). Measurement Uncertainty for PSA results may be higher than usual.

ALS Canada Ltd.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA23C2014**	Page	: 1 of 77
Client	: **ERM Consultants Canada Ltd.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Kimberly San	Account Manager	: Amber Springer
Address	: 10th Floor, 1100 Melville St. Vancouver BC Canada V6E 4A6	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 14-Sep-2023 09:30
PO	: 12970	Issue Date	: 01-Nov-2023 11:34
C-O-C number	: ----		
Sampler	: KB, SS		
Site	: ----		
Quote number	: VA23-BWGL100-005		
No. of samples received	: 73		
No. of samples analysed	: 73		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Laboratory Control Sample (LCS) outliers occur
- Method Blank value outliers occur - please see following pages for full details.
- Duplicate outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- Reference Material (RM) Sample outliers occur - please see the following pages for full details.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Biota**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Method Blank (MB) Values								
Metals	QC-MRG8-1208346 001	----	Manganese	7439-96-5	E440	0.080 mg/kg B	0.05 mg/kg	Blank result exceeds permitted value
Metals	QC-MRG8-1208346 001	----	Manganese	7439-96-5	E440A	0.016 mg/kg wwt	0.01 mg/kg wwt	Blank result exceeds permitted value

Result Qualifiers

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Duplicate (DUP) RPDs								
Metals	VA23C2014-038	006-HUCK	Copper	7440-50-8	E472	43.8 % DUP-H	40%	Duplicate RPD does not meet the DQO for this test.
Metals	VA23C2014-038	006-HUCK	Magnesium	7439-95-4	E472	41.6 % DUP-H	40%	Duplicate RPD does not meet the DQO for this test.
Metals	VA23C2014-038	006-HUCK	Manganese	7439-96-5	E472	67.1 % DUP-H	40%	Duplicate RPD does not meet the DQO for this test.
Metals	VA23C2014-038	006-HUCK	Copper	7440-50-8	E472A	43.8 % DUP-H	40%	Duplicate RPD does not meet the DQO for this test.
Metals	VA23C2014-038	006-HUCK	Magnesium	7439-95-4	E472A	41.6 % DUP-H	40%	Duplicate RPD does not meet the DQO for this test.
Metals	VA23C2014-038	006-HUCK	Manganese	7439-96-5	E472A	67.1 % DUP-H	40%	Duplicate RPD does not meet the DQO for this test.

Result Qualifiers

Qualifier	Description
DUP-H	*Duplicate results outside ALS DQO, due to sample heterogeneity.*

Reference Material (RM) Sample								
Metals	QC-MRG8-1208328 003	----	Calcium	7440-70-2	E440	140 % MES	70.0-130%	Recovery greater than upper control limit
Metals	QC-MRG8-1208328 003	----	Calcium	7440-70-2	E440A	140 % MES	70.0-130%	Recovery greater than upper control limit

Result Qualifiers

Qualifier	Description

Matrix: **Biota**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
MES	*Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).*							

Matrix: **Soil/Solid**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Duplicate (DUP) RPDs								
Metals	VA23C2014-001	021-SOIL	Arsenic	7440-38-2	E440	62.5 % DUP-H	30%	Duplicate RPD does not meet the DQO for this test.
Metals	VA23C2014-001	021-SOIL	Iron	7439-89-6	E440	46.4 % DUP-H	30%	Duplicate RPD does not meet the DQO for this test.

Result Qualifiers

Qualifier	*Description*
DUP-H	*Duplicate results outside ALS DQO, due to sample heterogeneity.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Biota**

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Biota**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Moisture Content by Gravimetry	E144 ALS Environmental - Vancouver	Biota	Puget Sound Water Quality Authority/CCME PHC in Soil - Tier 1	Moisture is measured gravimetrically by drying the sample at 105°C. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of the sample, expressed as a percentage.
Moisture Content by Gravimetry (Micro)	E144-H ALS Environmental - Vancouver	Biota	Puget Sound Water Quality Authority/BC MOE Lab Manual	Moisture is measured gravimetrically by drying the sample at <60°C for a minimum of 3 days to constant weight. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of soil, expressed as a percentage.
Metals in Biota by CRC ICPMS (DRY units, Routine)	E440 ALS Environmental - Vancouver	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Silver in Biota by CRC ICPMS (DRY units, Routine)	E440.Ag ALS Environmental - Vancouver	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Titanium in Biota by CRC ICPMS (DRY units, Routine)	E440.Ti ALS Environmental - Vancouver	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Metals in Biota by CRC ICPMS (WET units, Routine)	E440A ALS Environmental - Vancouver	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Titanium in Biota by CRC ICPMS (WET units, Routine)	E440A.Ti ALS Environmental - Vancouver	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Metals in Biota by CRC ICPMS (DRY units, Micro)	E472 ALS Environmental - Vancouver	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Silver in Biota by CRC ICPMS (DRY units, Micro)	E472.Ag ALS Environmental - Vancouver	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Titanium in Biota by CRC ICPMS (DRY units, Micro)	E472.Ti ALS Environmental - Vancouver	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Metals in Biota by CRC ICPMS (WET units, Micro)	E472A ALS Environmental - Vancouver	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Silver in Biota by CRC ICPMS (WET units, Micro)	E472A.Ag ALS Environmental - Vancouver	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Titanium in Biota by CRC ICPMS (WET units, Micro)	E472A.Ti ALS Environmental - Vancouver	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by High Resolution ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Mercury in Biota by CVAAS (DRY units, Routine)	E510 ALS Environmental - Vancouver	Biota	EPA 200.3/1631 Appendix (mod)	Samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by CVAAS.
Mercury in Biota by CVAAS (WET units, Routine)	E510A ALS Environmental - Vancouver	Biota	EPA 200.3/1631 Appendix (mod)	Samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by CVAAS.
Mercury in Biota by CVAAS (DRY units, Micro)	E511 ALS Environmental - Vancouver	Biota	EPA 200.3/1631 Appendix (mod)	Samples are homogenized and sub-sampled prior to hotblock digestion with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by CVAAS.
Mercury in Biota by CVAAS (WET units, Micro)	E511A ALS Environmental - Vancouver	Biota	EPA 200.3/1631 Appendix (mod)	Samples are homogenized and sub-sampled prior to hotblock digestion with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by CVAAS.
pH by Meter (1:2 Soil:Water Extraction)	E108 ALS Environmental - Vancouver	Soil/Solid	BC Lab Manual	pH is determined by potentiometric measurement with a pH electrode at ambient laboratory temperature (normally 20 ± 5°C), and is carried out in accordance with procedures described in the BC Lab Manual (prescriptive method). The procedure involves mixing the dried (at <60 ºC) and sieved (10mesh/2mm) sample with ultra pure water at a 1:2 ratio of sediment to water. The pH is then measured by a standard pH probe.
CSSC Particle Size Classification by Hydrometer	E180 ALS Environmental - Saskatoon	Soil/Solid	CCME Vol 4 Analytical Methods	A soil sample is disaggregated to pass a 2mm sieve. The <2mm specimen is then further disaggregated using Calgon solution and suspended in solution. Two hydrometer readings are measured at specific times to determine %clay and %silt+clay using the principles of Stokes' law. %silt and %sand are determined mathematically.
Total Carbon by Combustion	E351 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 21.2 (mod)	Total Carbon is determined by the high temperature combustion method with measurement by an infrared detector.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Inorganic Carbon by Acetic Acid pH Standard Curve	E354 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 20.2	Total Inorganic Carbon is determined by acetic acid pH standard curve, where a known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.
Metals in Soil/Solid by CRC ICPMS	E440 ALS Environmental - Vancouver	Soil/Solid	EPA 6020B (mod)	This method is intended to liberate metals that may be environmentally available. Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl. Dependent on sample matrix, some metals may be only partially recovered, including Al, Ba, Be, Cr, Sr, Ti, Tl, V, W, and Zr. Silicate minerals are not solubilized. Volatile forms of sulfur (including sulfide) may not be captured, as they may be lost during sampling, storage, or digestion. This method does not adequately recover elemental sulfur, and is unsuitable for assessment of elemental sulfur standards or guidelines. Analysis is by Collision/Reaction Cell ICPMS.
Mercury in Soil/Solid by CVAAS	E510 ALS Environmental - Vancouver	Soil/Solid	EPA 200.2/1631 Appendix (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl, followed by CVAAS analysis.
Particle Size Analysis (Pipette) - MMER Classification	EC184E ALS Environmental - Saskatoon	Soil/Solid	Metal Mining Technical Guidance for Environmental Effects Monitoring (2012)	The particle size determination is performed by various methods to generate a Grain Size curve. The data from the curve is then used to produce particle size ranges based on the Metal Mining Effluent Regulations (MMER) classification system for Environmental Effects Monitoring.
Total Organic Carbon (Calculated) in soil	EC356 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 21.2	Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon (TIC).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Metals and Mercury Biota Digestion	EP440 ALS Environmental - Vancouver	Biota	EPA 200.3	This method uses a heated strong acid digestion with HNO3, HCl, and H2O2 and is intended to provide a conservative estimate of bio-available metals.
Metals and Mercury Biota Digestion (Micro)	EP472 ALS Environmental - Vancouver	Biota	EPA 200.3	This method, designed for small sample amounts, uses a heated strong acid digestion with HNO3, HCl, and H2O2 and is intended to provide a conservative estimate of bio-available metals.
Leach 1:2 Soil:Water for pH/EC	EP108 ALS Environmental - Vancouver	Soil/Solid	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL	The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water.
Digestion for Metals and Mercury	EP440 ALS Environmental - Vancouver	Soil/Solid	EPA 200.2 (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl. This method is intended to liberate metals that may be environmentally available.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dry and Grind in Soil/Solid <60°C	EPP442 ALS Environmental - Saskatoon	Soil/Solid	Soil Sampling and Methods of Analysis, Carter 2008	After removal of any coarse fragments and reservation of wet subsamples a portion of homogenized sample is set in a tray and dried at less than 60°C until dry. The sample is then particle size reduced with an automated crusher or mortar and pestle, typically to <2 mm. Further size reduction may be needed for particular tests.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Biota**

Qualifiers

Qualifier	*Description*
DUP-H	*Duplicate results outside ALS DQO, due to sample heterogeneity.*

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Qualifiers

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Biota**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

Milad Khani	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

No. of samples received	: 58		
No. of samples analysed	: 58		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Biota**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Moisture Content by Gravimetry	E144	1236990	2	38	5.2	5.0	✓
Laboratory Control Samples (LCS)							
Moisture Content by Gravimetry	E144	1236990	2	38	5.2	5.0	✓
Method Blanks (MB)							
Moisture Content by Gravimetry	E144	1236990	2	38	5.2	5.0	✓

Matrix: **Soil/Solid**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Moisture Content by Gravimetry	E144 ALS Environmental - Vancouver	Biota	Puget Sound Water Quality Authority/CCME PHC in Soil - Tier 1	Moisture is measured gravimetrically by drying the sample at 105°C. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of the sample, expressed as a percentage.
Metals in Biota by CRC ICPMS (DRY units, Routine)	E440 ALS Environmental - Vancouver	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Silver in Biota by CRC ICPMS (DRY units, Routine)	E440.Ag ALS Environmental - Vancouver	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Titanium in Biota by CRC ICPMS (DRY units, Routine)	E440.Ti ALS Environmental - Vancouver	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Mercury in Biota by CVAAS (DRY units, Routine)	E510 ALS Environmental - Vancouver	Biota	EPA 200.3/1631 Appendix (mod)	Samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by CVAAS.
pH by Meter (1:2 Soil:Water Extraction)	E108 ALS Environmental - Saskatoon	Soil/Solid	BC Lab Manual	pH is determined by potentiometric measurement with a pH electrode at ambient laboratory temperature (normally 20 ± 5°C), and is carried out in accordance with procedures described in the BC Lab Manual (prescriptive method). The procedure involves mixing the dried (at <60 ºC) and sieved (10mesh/2mm) sample with ultra pure water at a 1:2 ratio of sediment to water. The pH is then measured by a standard pH probe.
Available Nitrate and Nitrite by Colourimetry (0.01M Calcium Chloride Ext.)	E269.N+N ALS Environmental - Saskatoon	Soil/Solid	Alberta Agriculture/APHA 4500-NO3 I (mod)	Plant available nitrate and nitrite are analyzed by colourimetry using a flow injection analyzer on a soil sample extract that has been extracted using 0.01M Calcium Chloride, then shaken well and filtered prior to analysis.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Carbon by Combustion	E351 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 21.2 (mod)	Total Carbon is determined by the high temperature combustion method with measurement by an infrared detector.
Total Inorganic Carbon by Acetic Acid pH Standard Curve	E354 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 20.2	Total Inorganic Carbon is determined by acetic acid pH standard curve, where a known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.
Available Phosphorus by FIALab (Modified Kelowna)	E384 ALS Environmental - Saskatoon	Soil/Solid	Comm. Soil Sci. Plant Anal, 25 (5&6)	Plant available phosphorus is extracted from air dried soil using a fixed ratio Modified Kelowna extraction. Phosphorus is determined by colorimetry using an flow injection analyzer.
Available Potassium by flame photometry (Modified Kelowna)	E390 ALS Environmental - Saskatoon	Soil/Solid	Comm. Soil Sci. Plant Anal, 25 (5&6)	Plant available potassium is extracted from soil using modified Kelowna solution. Potassium is determined by flame emission at 770 nm.
Metals in Soil/Solid by CRC ICPMS	E440 ALS Environmental - Saskatoon	Soil/Solid	EPA 6020B (mod)	This method is intended to liberate metals that may be environmentally available. Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl. Dependent on sample matrix, some metals may be only partially recovered, including Al, Ba, Be, Cr, Sr, Ti, Tl, V, W, and Zr. Silicate minerals are not solubilized. Volatile forms of sulfur (including sulfide) may not be captured, as they may be lost during sampling, storage, or digestion. This method does not adequately recover elemental sulfur, and is unsuitable for assessment of elemental sulfur standards or guidelines. Analysis is by Collision/Reaction Cell ICPMS.
Available Sulfate by ICPMS (0.01M Calcium Chloride Ext.)	E497.SO4 ALS Environmental - Saskatoon	Soil/Solid	Alberta Agriculture	Plant available sulfate is determined by ICPMS. Soil is extracted using a 0.01M calcium chloride solution. This extraction may also produce organic sulfur in the extracts when organic soils are analyzed.
Mercury in Soil/Solid by CVAAS	E510 ALS Environmental - Saskatoon	Soil/Solid	EPA 200.2/1631 Appendix (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl, followed by CVAAS analysis.
Particle Size Analysis (Pipette) - MMER Classification	EC184E ALS Environmental - Saskatoon	Soil/Solid	Metal Mining Technical Guidance for Environmental Effects Monitoring (2012)	The particle size determination is performed by various methods to generate a Grain Size curve. The data from the curve is then used to produce particle size ranges based on the Metal Mining Effluent Regulations (MMER) classification system for Environmental Effects Monitoring.
Total Organic Carbon (Calculated) in soil	EC356 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 21.2	Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon (TIC).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Metals and Mercury Biota Digestion	EP440 ALS Environmental - Vancouver	Biota	EPA 200.3	This method uses a heated strong acid digestion with HNO3, HCl, and H2O2 and is intended to provide a conservative estimate of bio-available metals.
Leach 1:2 Soil:Water for pH/EC	EP108 ALS Environmental - Saskatoon	Soil/Solid	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL	The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water.
Fixed ratio 0.01M Calcium Chloride extraction for plant available nutrients	EP269 ALS Environmental - Saskatoon	Soil/Solid	Alberta Agriculture	Plant available nutrients (N&S) extracted using 0.01M calcium chloride, then shaken well and filtered prior to analysis.
Modified Kelowna Extraction for soil	EP384 ALS Environmental - Saskatoon	Soil/Solid	Comm. Soil Sci. Plant Anal, 25 (5&6)	Plant available phosphorus and potassium are extracted from the soil using fixed ratio Modified Kelowna solution.
Digestion for Metals and Mercury	EP440 ALS Environmental - Saskatoon	Soil/Solid	EPA 200.2 (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl. This method is intended to liberate metals that may be environmentally available.
Dry and Grind in Soil/Solid <38°C	EPP441 ALS Environmental - Saskatoon	Soil/Solid	Soil Sampling and Methods of Analysis, Carter 2008	After removal of coarse fragments a portion of homogenized sample is set in a tray and dried at less than 38°C until dry. The sample is then particle size reduced with an automated crusher or mortar and pestle, typically to <2 mm. Further size reduction may be needed for particular tests.
Dry and Grind in Soil/Solid <60°C	EPP442 ALS Environmental - Saskatoon	Soil/Solid	Soil Sampling and Methods of Analysis, Carter 2008	After removal of any coarse fragments and reservation of wet subsamples a portion of homogenized sample is set in a tray and dried at less than 60°C until dry. The sample is then particle size reduced with an automated crusher or mortar and pestle, typically to <2 mm. Further size reduction may be needed for particular tests.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Biota**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

CERTIFICATE OF ANALYSIS

Work Order	: **VA23C2929**	Page	: 1 of 101
Client	: **Palmer Environmental Consulting Group Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Accounts Payable	Account Manager	: Amber Springer
Address	: 470 Granville Street Suite 630 Vancouver BC Canada V6C 1V5	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 604 629 9075	Telephone	: +1 604 253 4188
Project	: 2006506	Date Samples Received	: 26-Sep-2023 11:50
PO	: 15180	Date Analysis Commenced	: 08-Nov-2023
C-O-C number	: ----	Issue Date	: 24-Nov-2023 09:38
Sampler	: Marissa Heppner		
Site	: ----		
Quote number	: VA23-BWGL100-002		
No. of samples received	: 113		
No. of samples analysed	: 104		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Arshdeep Kaur	Lab Assistant	Metals, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Ragini Saini	Lab Assistant	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
mg/kg wwt	milligrams per kilogram wet weight

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Client	: Palmer Environmental Consulting Group Inc.	Laboratory	: ALS Environmental - Vancouver
Contact	: Accounts Payable	Account Manager	: Amber Springer
Address	: 3083-595 Burrard St Vancouver BC Canada V7X 1L3	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	:	Telephone	: +1 604 253 4188
Project	: 2006506	Date Samples Received	: 26-Sep-2023 11:50
PO	: 15180	Date Analysis Commenced	: 08-Nov-2023
C-O-C number	: ----	Issue Date	: 24-Nov-2023 09:41
Sampler	: Marissa Heppner 647 795 8153		
Site	: ----		
Quote number	: VA23-BWGL100-002		
No. of samples received	: 113		
No. of samples analysed	: 104		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Reference Material (RM) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Arshdeep Kaur	Lab Assistant	Vancouver Metals, Burnaby, British Columbia
Owen Cheng		Vancouver Metals, Burnaby, British Columbia
Ragini Saini	Lab Assistant	Vancouver Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Vancouver Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Vancouver Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Biota**
